L32 ANSWER 1 OF 14 HCAPLUS COPYRIGHT 2003 ACS on STN ACCESSION NUMBER: 2003:846781 HCAPLUS TITLE: Cholera vaccine candidate 638: intranasal immunogenicity and expression of a foreign antigen from the pulmonary pathogen Coccidioides immitis AUTHOR(S): Silva, Anisia J.; Mohan, Archana; Benitez, Jorge CORPORATE SOURCE: Biochemistry and Immunology, Department of Microbiology, Morehouse School of Medicine, 720 Westview Dr., SW, Atlanta, GA, 30310-1495, USA Vaccine (2003), 21(32), 4715-4721 SOURCE: CODEN: VACCDE; ISSN: 0264-410X PUBLISHER: Elsevier Science Ltd. DOCUMENT TYPE: Journal LANGUAGE: English Vibrio cholerae strain 638 is a live genetically attenuated candidate cholera vaccine in which the CTXΦ prophage encoding cholera toxin has been deleted and hapA, encoding an extracellular Zn-dependent metalloprotease, was insertionally inactivated. Strain 638 was highly immunogenic when inoculated to adult Swiss mice by the intranasal route as judged by the induction of a strong serum vibriocidal antibody response. A side-by-side comparison of strain 638 with its isogenic hapA+ precursor (strain 81) in the above model indicated that inactivation of hapA does not affect immunogenicity. The spherule-associated antigen 2/proline-rich antigen (Ag2/PRA) of Coccidioides immitis has been shown to protect mice against coccidioidomycosis to an extent dependent on the modes of antigen presentation and challenge with C. immitis arthrospores. this work, we demonstrate the use of a live genetically attenuated V. cholerae strain to deliver Ag2/PRA. Ag2/PRA was expressed in 638 as a fusion protein with the Escherichia coli heat labile toxin B subunit leader peptide using the strong Tac promoter. The recombinant Ag2/PRA was efficiently expressed, processed and secreted to the periplasmic space. Intranasal immunizations of adult mice with strain 638 expressing Ag2/PRA induced serum vibriocidal antibody response to the vector strain and serum total IgG response to Ag2/PRA. Strain 638 expressing PRA could be recovered from trachea and lung up to 20 h after immunization but was effectively cleared 72 h post-inoculation. PRI AB The invention provides vectors (such as viral

vectors, plasmid vectors or phagemids) comprising: (a) a heterologous nucleotide sequence encoding an antigenic polypeptide from a pathogen (such as viral, bacterial, parasitic or fungal); (b) a nucleotide sequence encoding a protease inhibitor (such as human PI31); a nucleotide sequence for a constitutive, regulatable, and/or cell/tissue-specific promoter; and (d) a nucleotide sequence encoding an inhibitory RNA mols., specifically an antisense human HERNA oligonucleotides. The invention also provides vectors comprising a nucleotide sequence encoding CIITA, a polypeptide that stimulates the expression of MHC class II genes. The invention further provides the use of said vectors as vaccines in production of an immune response (humoral) to said antigens in an animal, such as human, wherein said vaccination may be against a viral, fungal, bacterial or parasitic disorder. Still further, the invention relates: (a) using said vectors in production of antibodies, wherein said antibodies may be of therapeutic and/or of diagnostic use; (b) that said vectors may be adapted for expression of humanized or chimeric antibodies; and (c) that said vectors may be used to used to immunize animals for production of hybridomas expressing a monoclonal antibody against antigen of interest. Finally, the invention provides the cDNA sequences of mouse CIITA, and human PI31, and partial cDNA sequence of human HERNA helicase. The invention related that the use of said vectors containing said sequences can be used to enhance secretion of translated immunogen, and enhance DNA vaccination bias away from an MHC class I event towards MHC class II event. In the examples, the invention presented the construction of two vectors, pcDNAFinal and pcDNA6TR-IRES-CIITA, wherein pcDNAFinal contains nucleotide sequences encoding immunogen parathyroid hormone-related protein (PTHrP), antisense HERNA mRNA, PI31 and CD4+ T-cell epitope from lymphocytic choriomeningitis virus and wherein

pcDNA6TR-IRES-CIITA encodes CIITA. Specifically, the invention related that: (a) antisense HERNA RNA can increase the transcriptional efficiency of **vectors** resulting in greater levels of transgene expression; (b) PI31 can inhibit proteasome digestion of **recombinant** antigen making it more assessable to MHC class II antigens; (c) inclusion of CD4+ T-cell epitope ensured that degraded immunogen-MHC class II complex bound to CD4+ T cells; and (d) inclusion of CIITA **protein** allowed for over-expression of MHC class II antigens.

AB The cDNAs for Saccharomyces cerevisiae genes responding to BAX gene expression as well as the **proteins** encoded by these cDNAs are disclosed. Addnl., Candida albicans and human homologs of the S. cerevisiae genes/**proteins** are provided. The invention describes the use of nucleic acids and **proteins** which are involved in apoptosis in yeast or fungi for the preparation of medicines for treating diseases associated with yeast or fungi or for the treatment of proliferative disorders or for preventing apoptosis in certain diseases. Methods are provided to identify compds. which selectively modulate the expression or functionality of said

proteins in the same or a parallel pathway. Also provided are compds. as well as pharmaceutical compns., medicines and vaccines. The invention also comprises new nucleic acid sequences, probes and primers derived thereof, expression vectors and host cells transformed with said vectors, polypeptides and antibodies raised against said polypeptides.

The vaccine efficacy of the gene sequence encoding the signal peptide of the antigen known as antigen 2 or proline-rich antigen (Ag2/PRA), an immunodominant antigen present in the cell wall of the fungal pathogen Coccidioides immitis, was investigated in a murine model of coccidioidomycosis. Expression plasmids for Ag2/PRA(1-18) DNA (signal sequence), Ag2/PRA(19-194) DNA (lacking the signal sequence), and Aq2/PRA(1-194) DNA (full length) were inserted in the pVR1012 vector, and the constructs were used to vaccinate the highly susceptible BALB/c mouse strain. Immunization with the signal gene sequence significantly reduced the fungal burden in the lungs and spleens of mice 12 days after i.p. challenge with a LD of 2500 C. immitis arthroconidia, to a level comparable to the protection induced in mice immunized with the full-length Ag2/PRA(1-194) DNA. The Aq2/PRA(19-194) gene protected mice but to a significantly lower level than the signal sequence or the full-length Ag2 gene. The immunizing capacity of Ag2/PRA(1-18) was not attributable to a nonspecific immunostimulatory effect of DNA, as evidenced by the fact that mice immunized with a frameshift mutation of Ag2/PRA(1-18) were not protected against challenge. Furthermore, a synthetic peptide corresponding to the translated sequence of Aq2/PRA(1-18) DNA protected mice, albeit at a lower level than the Ag2/PRA(1-18) DNA vaccine. The protection induced with the signal gene vaccine correlated with the production of gamma interferon when splenocytes from Ag2/PRA(1-18)-immunized mice were stimulated with recombinant full-length Ag2 and was not associated with the production of anti-Coccidioides IgG antibody. This is the first study to establish that a signal peptide sequence alone, administered as a gene vaccine or synthetic peptide

, can induce protective immunity against a microbial pathogen.

L32 ANSWER 5 OF 14 HCAPLUS COPYRIGHT 2003 ACS on STN 2002:366877 HCAPLUS ACCESSION NUMBER: DOCUMENT NUMBER: 137:137416 TITLE: Complementation of the ODC-Escherichia coli (EWH319) null mutant by expression of the Coccidioides immitis ornithine decarboxylase (CiODC) gene AUTHOR(S): Guevara-Olvera, L.; Guevara-Gonzalez, R. G.; Munoz-Sanchez, C. I.; Gonzalez-Chavira, M. M. CORPORATE SOURCE: Inst. Tecnologico de Celaya, Depto. Ingenieria Bioquimica, Guanajuato, 38010, Mex. SOURCE: Informacion Tecnologica (2002), 13(2), 177-181 CODEN: ITECFG; ISSN: 0716-8756 PUBLISHER: Centro de Informacion Tecnologica DOCUMENT TYPE: Journal LANGUAGE: Spanish The aim of this study was to determine the function of the ornithine decarboxylase (CiODC) gene from Coccidioides immitis, a human respiratory fungal pathogen. A fragment of complementary DNA (cDNA) coding for CiODC protein was cloned into the pET-28b vector. The pET-CiODC recombinant plasmid was used to transform the EWH319 strain of Escherichia coli, which lacks the ODC gene and all others which synthesize polyamines and shows reduced growth due to this deficiency. Introduction of the transformant plasmid restored the bacterial growth in minimal M9 medium. The complemented strain EWH319.pET-CiODC showed ODC activity which was inhibited by 1,4-diamino-2-butanone (DAB) a competitive inhibitor which is specific for eukaryote ODCs. Based on the present results it was concluded that expression of the CiODC gene from Coccidioides immitis conferred a fundamental function for the growth of Escherichia coli.      The present invention relates to a method of making human monoclonal
```

antibodies through the use of novel hybrid cells. In the invention, hybrid cells are created by combining three elements: a fusion partner cell, a fusion cell (in particular a human B-lymphocyte), and an ectopic telomerase gene. Mammalian cell lines that ectopically express telomerase and methods of using such cell lines in producing novel hybrid cells (hybridomas) that produce human monoclonal antibodies; human monoclonal antibodies produced by such novel hybridomas and DNA constructs useful for producing mammalian cell lines that ectopically express telomerase are described. The expression of an ectopic telomerase gene in hybrid cells formed from primary human B-lymphocytes and fusion partner cells (other human non-B lineage cells) improves their growth rate, level of Ig expression, stability of Ig expression, and the ability to be cloned by limiting dilution A murine myeloma cell line that ectopically expressed human telomerase was created, as well as murine/human cell hybrids.

    Coccidioides immitis antigens which stimulate a T helper
     cell 1 (Th1) pathway of host immune response are considered to be
     essential components of a vaccine against coccidioidomycosis
       Recombinant urease (rURE) and recombinant
     heat shock protein 60 (rHSP60) of C. immitis were
     expressed in Escherichia coli and tested as vaccine candidates in
     BALB/c mice. A synthetic oligodeoxynucleotide which contained
     unmethylated CpG dinucleotides and was previously shown to enhance a
     murine Th1 response was used as an immunoadjuvant. T cells isolated
     from the spleens and lymph nodes of the rURE- and rHSP60-immune mice
     showed in vitro proliferative responses to the resp.
     recombinant protein, but only those T lymphocytes
     from rURE-immunized mice revealed markedly elevated levels of
     expression of selected Th1-type cytokine genes. BALB/c mice
     immunized s.c. with rURE and subsequently challenged by the i.p.
```

route with a lethal inoculum of C. immitis arthroconidia demonstrated a significant reduction in the level of C. immitis infection compared to control animals. RHSP60 was much less effective as a protective antigen. Evaluation of cytokine gene expression in lung tissue and levels of recombinant urease-specific Igs (IgG1 vs. IgG2a) in murine sera at 12 days after challenge provided addnl. evidence that immunization with rURE stimulated a Th1 response to the pathogen. Urease was further evaluated by expression of the URE gene in a mammalian plasmid vector (pSecTag2A.URE) which was used to immunize mice by the intradermal route. In this case, 82% of the vector construct-immunized animals survived more than 40 days after i.p. infection, compared to only 10% of the mice immunized with the vector alone. In addition, 87% of the pSecTag2A.URE-immunized survivors had sterile lungs and spleens. These data support the need for further evaluation of the C. immitis urease as a candidate vaccine against coccidioidomycosis.

Previous studies from our laboratory established that C-ASWS, an alkali-soluble, water-soluble extract from cell walls of Coccidioides immitis, protects mice against lethal challenge with this fungus. The C-ASWS extract contains a glycosylated protein, designated antigen 2 (Ag2), and a polysaccharide antigen. We recently cloned Aq2 cDNA and showed that the recombinant fusion protein elicited strong delayed-type hypersensitivity responses in immunized mice. This investigation was undertaken to determine if the recombinant Ag2 protein, expressed as an Ag2-glutathione S-transferase (GST) fusion protein, or Ag2 cDNA would protect mice against lethal challenge with C. immitis. The recombinant Ag2-GST protein protected BALB/c mice against i.p. challenge with 250 arthroconidia, as assessed by a decrease in fungal CFU in tissues. The Ag2-GST-immunized mice did not show, however, an increased survival during a 30-day period postinfection. By contrast, immunization of mice with Ag2 cDNA ligated into the pVR1012 plasmid engendered protection against i.p. challenge with 2,500 arthroconidia and against pulmonary challenge with 50 arthroconidia. Vaccine efficacy paralleled the development of delayed-type hypersensitivity responses to C. immitis antigen.

Whereas mice vaccinated with the **recombinant** Ag2-GST **protein** did not mount footpad hypersensitivity to C-ASWS or the **recombinant** Ag2-GST **protein**, mice vaccinated with the pVR1012-Ag2 construct mounted a strong footpad hypersensitivity and their spleen cells secreted gamma interferon upon in vitro stimulation with the Ag2-containing C-ASWS extract This is the first investigation to show that genetic immunization can protect against lethal challenge with C. immitis.

DOCUMENT TYPE: LANGUAGE: Journal English

In previous work, antibodies in serum samples from patients with coccidioidomycosis were found to react with a proline-rich antigen (PRA) isolated from spherules of Coccidioides immitis, and the gene encoding this antigen was cloned. expressed and purified recombinant PRA (rPRA) by removing the majority of amino acids contributed by the vector from the fusion protein. Purified rPRA reacted with serum IgG antibodies in 37 of 42 patients with culture-proven progressive pulmonary or extrapulmonary coccidioidal disease; specific antibodies in dilns. ranging from 1:40 to 1:102,400 were demonstrated (sensitivity, 88%). In contrast, for >95% of patients without coccidioidomycosis reactivity of <1:40 was demonstrated (specificity, 97%). Of 18 patients with primary self-limited coccidioidomycosis, none had detectable antibodies in serum samples collected up to 141 days after illness began. The association of antibodies to rPRA with progressive infection may have prognostic value.

Previous expts. have provided evidence that Coccidioides immitis antigen 2 (Ag2) is a major T-cell-reactive component of mycelia and spherule cell walls. Here the authors report the identification and cloning of the cDNA that encodes Ag2 from a lambda ZAP cDNA expression library constructed from spherule-derived DNA sequence anal. established that the 1,255-bp clone contains a 174-bp 5' untranslated region, a 582-bp open reading frame which encodes for a protein consisting of 194 amino acids, and a 375-bp 3' untranslated region, including a poly(A) The recombinant Ag2 protein has a predicted mol. mass of 19.5 kDa and contains an 18-amino-acid N terminus which has been tentatively identified as a signal peptide. The Ag2 cDNA was ligated into the pGEX-4T-3 vector and expressed in Escherichia coli TG-1 cells as a glutathione S-transferase fusion protein. The recombinant fusion protein showed reactivity with sera from patients with coccidioidomycosis and elicited delayed-type footpad hypersensitivity responses in Coccidioides-immune mice. These results suggest that the Ag2 cDNA can be used for the large-scale production of this immunol. important protein.

CORPORATE SOURCE:

Detection of anti-Coccidioides complement-fixing (CF) antibody is a valuable diagnostic and prognostic aid in coccidioidomycosis. The CF antibody response is directed against a heat-labile antigen that has chitinase activity, hereafter referred to as the CF/chitinase protein. To identify and clone this immunoreactive enzyme, the authors constructed a Coccidioides immitis cDNA lambda ZAP expression library from spherule RNA and detected fusion peptides expressing CF epitopes by immunoscreening. A cDNA clone consisting of 1623 bp was identified, sequenced, and found to contain a single open reading frame that encodes a protein of 47 kDa with 427 amino acids. Deduced amino acid sequence analyses showed that the cloned CF/chitinase cDNA contains a 35-amino-acid region, beginning at Ser-18 and ending at Arg-52, which has 92% homol. with the reported N-terminal amino acid sequence of authentic CF/chitinase

protein. The first 17 amino acids in the deduced sequence of the cloned cDNA are not present on the mature CF/chitinase protein, suggesting that it may be a signal peptide

. Expression of the CF/chitinase cDNA insert by using the pGEX-4T-3 vector yields a fusion peptide that bears

CF-specific epitopes and shows chitinase activity. The CF/chitinase clone will enable large-scale production of the recombinant CF antigen for use in immunoassays and facilitate studies on the role of chitinase in the morphogenesis of C immitis.

Results of earlier investigations have indicated that the saprobic phase of Coccidioides immitis produces a heat-stable, 19-kDa antigen with serine proteinase activity which has been suggested to be specific for this pathogenic fungus. In the present study the authors have determined the N-terminal and partial internal amino acid sequences of the purified, 19-kDa antigen, cloned the gene which encodes this polypeptide, and confirmed that the secreted proteinase is a Coccidioides-specific antigen (CS-Aq). Both the genomic and cDNA sequences are reported and reveal that the csa gene which encodes this antigen has no introns. A 543-bp open reading frame encodes a 181-amino-acid-containing protein with a predicted mols. mass of 19.8 kDa and an isoelec. point of 8.3. The csa gene was localized on chromosome I of three representative C. immitis clin. isolates on the basis of Southern hybridizations. Expression of the csa gene in Escherichia coli using the pET21a plasmid vector yielded a recombinant protein that was recognized in immunoblot assays by antibody raised to the purified 19-kDa CS-Aq. Secretion of the native antigen is suggested to occur by cleavage of a putative 23-residue signal peptide. The native CS-Ag showed a low degree of glycosylation. Anal. of the carbohydrate composition of the CS-Ag revealed xylose, mannose, galactose, and qlucose. However, the purified antigen showed no affinity for Con A. A PCR method with specificity and high sensitivity for detection of C. immitis genomic DNA, using a pair of synthetic oligonucleotide primers whose sequences were based on that of the csa gene, was developed. A 520-bp product was amplified only when C. immitis genomic DNA was used as the template. The lower limits of DNA detection using this PCR method were 1 pg of C. immitis genomic DNA by ethidium bromide staining and 100 fg after Southern hybridization. The csa gene-based PCR method for detection of C. immitis DNA is useful for culture identification and may have clin. applications for the diagnosis of coccidioidal infections.

T-cell mediated immune response to coccidioidomycosis has been shown to be the principal mechanism of resistance to this respiratory fungal disease in exptl. animals. In this study, a Coccidioides immitis antigen-specific murine T-cell line was used to identify macromols. capable of eliciting an immune mouse T-cell proliferative response. The murine T-cell line was selected on the basis of its strong pos. response to a soluble conidial wall fraction (SCWF), which had previously been shown to be reactive in humoral and cellular immunoassays. An antigen-specific T-cell line rather than T-cell clones was used to identify multiple antigens. The T-cell immunoblot method was employed first to identify immunoreactive subfractions of the SCWF, and then to identify T-cell fusion proteins (FPs) obtained from a cDNA expression library constructed in Agtll. The library was screened with anti-SCWF. The nucleotide sequence of a 0.2-kb cDNA insert encoding a FP which elicited vigorous T-cell response was determined A construct of this insert was subcloned into the pET expression vector system and 6.5-kDa recombinant protein (RP) expressed in Escherichia coli was isolated. The RP and FP were shown to be homologous on the basis of identify of their amino acid sequences. Antibody raised in guinea pigs against the RP recognized a 59-kDa native protein of the mycelial culture filtrate produced by 3 sep. strains of C. immitis, and reacted with the cell wall of arthroconidia as detected by immunofluorescence microscopy. In this study, a potentially important T-cell stimulating antigen of C. immitis was identified and partly characterized.

NOVELTY - A chitin-binding, chitinase-inactive **polypeptide** (I) comprising a chitin-binding fragment of 54 C-terminal amino acids of a fully defined human chitinase sequence (S1) of 466 amino acids as given in the specification, is new. (I) is chosen from **polypeptides** having sequence of amino acid residues 347-397 to 445 of (S1).

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for:

- (1) a fusion **protein** (II) comprising (I) fused to a heterologous **polypeptide**;
 - (2) a composition (III) comprising (I) and a diluent;
- (3) a composition (IV) comprising (I) conjugated to an antifungal agent;
- (4) a composition (V) comprising (I) conjugated to a detectable label;
- (5) a kit (VI) for diagnosing the presence of chitin in a sample comprising the composition;
 - (6) a purified, isolated polynucleotide (VII) encoding (I);
 - (7) a vector (VIII) comprising (VII);
- (8) a host cell (IX) transformed or transfected with (VII) in a manner allowing the expression of (I) encoded by (VII) in (IX);
 - (9) a polypeptide produced by culturing (IX); and
- (10) a monoclonal antibody (X) that specifically binds to an epitope within the 54C-terminal amino acid of (S1).

 ACTIVITY Fungicide.

Anti-fungal activity of recombinant chitinase in vivo in mice was determined as follows. Female Balb/c mice, 6-8 weeks old, were administered 0.5, 5.0, 50 mg/kg recombinant human chitinase by intravenous injection in the tail vein. The mice was infected with the fungi, varying doses of test drug was administered to the animals and their survival is measured over time. Specifically, acute systemic candidiasis was achieved in mice by intraperitoneal or intravenous challenge of 10 multiply 106 colony forming units (CFU) candida albicans. The recombinant

chitinase was administered before or at 1 to 5 hours after challenge, and the number of survivors was determined after five days. In addition, the mice can be sacrificed and fungal load can be determined in specific organs. Alternatively, the mice were challenged with lower doses of fungi, e.g., Aspergillus (8-10 multiply 106 CFU) or Candida (1 multiply 106 CFU) in which case survival can be measured at more distant time points, e.g. 45 days. The long term fungicidal/fungistatic activity of a chitinase may be evaluated by continuing therapy for a week or more, e.g. 11 days, and following the animals over several weeks, e.g. 18 days to one month. The result showed that effective anti-fungal agent (recombinant chitinase) enhanced the long term survival of animals and reduced fungal load in blood and organs.

MECHANISM OF ACTION - Lysis of fungal cell wall and membrane. USE - (III) or (IV) is useful for treating (M1) fungal infection which involves administering (III) or (IV) to a subject suffering from fungal infection. (M1) further comprises administering a non-chitinase antifungal agent. (V) is useful for detecting the presence of chitin in a sample which involves contacting the sample with (V) and determining the amount of labeled polypeptide bound to chitin. (claimed).

(III), (IV) or (V) is useful for treating fungal infections such as candidiasis, aspergillosis, coccidioidomycosis, blastomycosis, paracoccidioidomycosis, histoplasmosis, cryptococcosis, chromoblastomycosis, sporotrichosis, mucormycosis, and the dermatophytoses can manifest as acute or chronic disease. (VII) is useful in hybridization assays to detect the capacity of cells to synthesize chitinase and for diagnostic methods useful for identifying a genetic alteration(s) in the chitinase locus that underlies a disease state or states. (X) is useful for detecting or quantifying the presence of chitin-binding domain, and for detecting or quantifying the presence of yeast or fungi, e.g., by adding a chitin-binding domain which binds to the yeast of fungi. (X) is also useful for detecting chitin-binding domain in human blood samples which indicates a disease state involving chitinase, such as Gaucher's disease. Dwg.0/0

AB Vibrio cholerae strain 638 is a live genetically attenuated

candidate cholera vaccine in which the CTXPhi prophage encoding cholera toxin has been deleted and hapA, encoding an extracellular Zn-dependent metalloprotease, was insertionally inactivated. Strain 638 was highly immunogenic when inoculated to adult Swiss mice by the intranasal route as judged by the induction of a strong serum vibriocidal antibody response. A side-by-side comparison of strain 638 with its isogenic hapA(+) precursor (strain 81) in the above model indicated that inactivation of hapA does not affect immunogenicity. The spherule-associated antigen 2/proline-rich antigen (Ag2/PRA) of Coccidioides immitis has been shown to protect mice against coccidioidomycosis to an extent dependent on the modes of antigen presentation and challenge with C. immitis arthrospores. In this work, we demonstrate the use of a live genetically attenuated V. cholerae strain to deliver Ag2/PRA. Ag2/PRA was expressed in 638 as a fusion protein with the Escherichia coli heat labile toxin B subunit leader peptide using the strong Tac promoter. The recombinant Ag2/PRA was efficiently expressed, processed and secreted to the periplasmic space. Intranasal immunizations of adult mice with strain 638 expressing Ag2/PRA induced serum vibriocidal antibody response to the vector strain and serum total IgG response to Ag2/PRA. Strain 638 expressing PRA could be recovered from trachea and lung up to 20h after immunization but was effectively cleared 72h post-inoculation.

 - (c) step (iii) of the above method;
 - (d) exposing the duplicate array to a reference agent; and
- (e) detecting a signal generated by the reporter molecule as a result of exposure to the agent and to the reference agent; and
- (5) A vector comprising a reporter molecule, a splice acceptor site and an internal ribosome entry site, where the splice acceptor and the internal ribosome entry site are operably linked to facilitate expression of the reporter molecule.
- USE The method is useful in identifying biologically active agents and the genes through which the agents act, in screening potential drugs for their ability to activate certain drug targets in a high-throughput assay, in identifying relationships between signaling pathways and specific signals that could be useful in eventually directing the differentiation of embryonic stem cells, and in toxicology assays by testing for unwanted activation or inhibition of specific signaling pathways. The **vector** is useful in carrying out the above methods (claimed).

AB WO 200253728 A UPAB: 20020919

NOVELTY - Constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker, and modifying other allele by recombination, of a promoter replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter, si new.

DETAILED DESCRIPTION - Constructing (M1) a strain of diploid

fungal cells in which both alleles of a gene are modified, comprising constructing a strain of diploid fungal cells in which both alleles of a gene are modified, comprises modifying one allele in diploid fungal cells by recombination using a gene disruption cassette comprising a first nucleotide sequence encoding an expressible selectable marker, to provide heterozygous diploid fungal cells in which the first allele is inactivated, and modifying the second allele by recombination using a promoter replacement fragment comprising a second nucleotide sequence encoding a heterologous promoter, so that expression of the second allele is regulated by the heterologous promoter, where the gene encodes a polypeptide required for proliferation of Candida albicans, where the **polypeptide** is chosen from the amino acid sequence (S1) of 932 essential genes listed in the specification. INDEPENDENT CLAIMS are also included for the following:

- (1) assembling (M2) a collection of diploid fungal cells each compring modified alleles of a different gene, by modifying both alleles of the gene by (M1) and repeating the steps several times, where a different gene is modified with each repetition;
- (2) a strain (I) of diploid fungal cells comprising modified alleles of a gene, where the first allele is inactivated by a gene disruption cassette comprising a nucleotide sequence encoding an expressible selectable marker, and the expression of the second allele is regulated by a heterologous promoter that is operably linked to the coding region of the second allele;
 - (3) a collection of diploid fungal strains comprising (I);
- (4) a nucleic acid molecule microarray comprising several nucleic acid molecules, each comprising a nucleotide sequence that is hybridizable to a target nucleotide sequence chosen from 932 nucleotide sequences (S2) of the open reading frame (ORF) of essential genes, gene names listed in the specification, no sequences are given;
- (5) a purified or isolated nucleic acid molecule (II) comprising a nucleotide sequence encoding a gene product required for proliferation of C. albicans, and comprising (S1);
- (6) a nucleic acid molecule (III) comprising at least 10-100 consecutive nucleotides of (S2);
- (7) a purified or isolated nucleic acid molecule (IV) obtained from an organism other than C. albicans or Saccharomyces cerevisiae comprising at least 30 % identity to a (S2), as determined using BLASTN version 2.0 with the default parameters;
- (8) a vector containing the promoter operably linked to (II), (III) or (IV);
 (9) a host cell containing the **vector** of (9);
- (10) a purified or isolated polypeptide comprising a sequence chosen from 61 sequences not given in the specification;
- (11) a purified or isolated polypeptide (V) obtained from an organism other than C. albicans or S. cerevisiae comprising at least 30 % similarity to (S1), as determined using FASTA version 3.0t78 with the default parameters;
- (12) a fusion protein comprising a fragment of a first polypeptide fused to a second polypeptide, the fragment at least 6 consecutive residues of (S1);
 - (13) producing (V);
- (14) identifying (M3) a compound which modulates the activity of a gene product encoded by a nucleic acid comprising (S2), by contacting the gene product with a compound, and determining if the

compound modulates the activity of the gene product;

- (15) eliciting an immune response in an animal, by introducing into the animal a composition comprising an isolated polypeptide having 6 consecutive residues of (S1);
- (16) a strain of C. albicans where a first allele of a gene comprising (S2) is inactive and a second allele is under the control of a heterologous promoter;
- (17) identifying a compound or binding partner that binds to a **polypeptide** comprising (S1) or its fragment;
- (18) identifying (M4) a compound having the ability to inhibit growth or proliferation of C. albicans, by reducing the level or activity of a gene product encoded by (S2) in the C. albicans cell relative to a wild type cell, where the reduced level is not lethal to the cell, contacting the cell with a compound and determining if the compound inhibits the growth or proliferation of the cell;
- (19) inhibiting (M5) growth or proliferation of C. albicans cells, by contacting the cells with the compound that reduce the level of or inhibit the activity of (S1) or (S2);
- (20) manufacturing an antimycotic compound, by screening several compounds to identify a compound that reduces the activity or level of a gene product encoded by (S2) and manufacturing the compound identified;
- (21) treating (M6) an infection of a subject by C. albicans, by administering compound (C) that reduces the activity or level of a gene product encoded by (S2);
 - (22) an antibody preparation (VI) which binds (V); and
- (23) correlating changes in the levels of **proteins** or gene transcripts with the inhibition of growth or proliferation of a diploid fungal cell, by generating a first **protein** expression profile for or transcription profile for a control diploid fungal cell which comprises two wild type alleles of the gene, culturing (I) under conditions where the second allele of the gene is underexpressed, not expressed or overexpressed, and generating a second **protein** expression profile for the cultured cells, and comparing the profiles.

ACTIVITY - Fungicide; Plant Antifungal.

No biological data is given.

MECHANISM OF ACTION - None given.

USE - (M1) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells having both alleles modified are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent, an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian disease. (M3) is useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon compound catabolism, biosynthetic, transporter, transcriptional, translational, signal transduction, DNA replication and cell division activity. (M4) is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans. (M5) is useful for inhibiting growth or proliferation of C. albicans cells. (M6) is useful for treating infection by C. albicans. (All claimed). Dwg.0/6

NOVELTY - Nucleic acid molecules comprising fungal, e.g.

Cochliobolus heterostrophus, genes from a peptide

synthetase gene cluster, e.g. an iron reductase and/or a permease or a major facilitator superfamily (MFS) transporter, are new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) an isolated polynucleotide (N1) comprising a fungal nucleic acid segment which encodes a **polypeptide** which is substantially similar to a **polypeptide**, encoded by a nucleic acid sequence (NA1) comprising an open reading frame comprising the 2435 (S46), 1836 (S48), or 2073 (S55) base pair (bp) sequence defined in the specification, or their complements;

(2) an isolated polynucleotide (N2) comprising a fungal nucleic

acid segment which is substantially similar to NA1, or its complements;

- (3) an isolated polynucleotide (N3) comprising a fungal nucleic acid segment which hybridizes under stringent hybridization conditions to S46, S48, S55, or its complements;
- (4) an isolated ${\bf polypeptide}$ (P1) encoded by N1, N2 or N3;
- (5) an expression cassette comprising a promoter operably linked to N1, N2 or N3;
- (6) a **recombinant vector** comprising N1, N2 or N3, where the **vector** is capable of being stably transformed into a host cell;
- (7) a host cell comprising the expression cassette of (5) or the **vector** of (6);
- (8) a method (M1) for identifying an agent having fungicidal or mycocidal activity, comprising contacting a fungus with an agent that binds to or inhibits P1, and identifying an agent having fungicidal or mycocidal activity;
- (9) a method (M2) for identifying an inhibitor of a polypeptide, comprising contacting a host cell which expresses a polypeptide encoded by N1, N2 or N3 with an agent, and identifying an agent that inhibits the activity of the polypeptide;
 - (10) an agent identified by the M1 or M2;
- (11) a method of inhibiting the growth or pathogenicity of a fungus, comprising contacting the fungus with the agent of (10) in an amount sufficient to inhibit the growth or pathogenicity of the fungus;
- (12) a method for identifying an agent that modulates a polypeptide associated with pathogenicity of a fungus, comprising contacting a fungus with an agent that binds P1, and identifying an agent that modulates the pathogenicity of the fungus;
- (13) a method for identifying an agent that modulates the pathogenicity of a fungus, comprising contacting a fungus with an agent that inhibits the activity of Pl, and identifying an agent that modulates the pathogenicity of the fungus;
- (14) a method (M3) of identifying agents that alter the phenotype of a fungal pathogen or mycogen, comprising:
- (a) contacting an agent to be tested with one or more cells of a fungal pathogen or mycogen where:
- (i) the cells comprise a nucleotide sequence encoding a **polypeptide** that is substantially similar to the 812 (S47), 611 (S49) or 487 (S56) amino acid sequence defined in the specification; or
- (ii) the cells have a mutation in N1, N2 or N3, where the mutation results in overexpression or underexpression of the encoded polypeptide; and
- (b) detecting or determining whether the agent selectively modulates expression or function or metabolic pathways associated with the **polypeptide**, therefore altering a phenotype of the cells relative to cells not contacted with the agent;
 - (15) an isolated antibody (Abl) which specifically binds to P1;
- (16) a method (M4) to prevent or inhibit infection of an animal or plant by a fungal pathogen, comprising administering to the animal or plant an effective amount of the agent of (10) for a time and under conditions sufficient to inhibit or prevent fungal growth or reproduction;
 - (17) the sequence of N1, N2 or N3, or the amino acid sequence

of Pl stored on a computer readable medium; and

(18) a transformed plant, the genome of which expresses a chimeric DNA molecule which encodes a gene product which confers resistance or tolerance to the plant to a fungal pathogen by inhibiting fungal iron metabolism or siderophore production.

ACTIVITY - Fungicidal; Mycocidal; Antibacterial; Antiarthritic; Dermatological; Antiinflammatory.

No biological data given.

MECHANISM OF ACTION - Antisense therapy.

No biological data given.

USE - The polynucleotides and polypeptides are useful for identifying a novel fungicidal or mycocidal mode of action which permits rapid discovery of novel inhibitors of gene products that are useful as fungicides or mycocides.

The agents and antisense DNA are useful as fungicides to suppress the growth of pathogenic fungi. The fungal pathogens include plant pathogens such as Septoria trici, or Cochliobolus heterostrophus, or animal pathogens such as Candida albicans.

The anti-fungal agents are particularly useful for treating fungal infections of vertebrates, including immunocompromised vertebrates, for e.g. pneumonia, arthritis, miliary disease, bone and joint infection, skin disease, aesophagitis, vaginitis, onychomycosis, and inflammation of urinary tract, kidney, liver, brain, gastrointestinal tract and lung. NOVELTY - A recombinant spherical outer wall glycoprotein 58 (SOWgp58) (I) from Coccidioides immitis, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for:

- (1) antigens (II) for serodiagnosis of coccidioidomycosis comprising a recombinant spherical outer wall glycoprotein (SOWgp);
- (2) an isolated nucleic acid (III) that hybridizes under highly stringent conditions to a probe of sequences (S1: 900 base pairs), (S3: 1244 base pairs), (S9: 1504 base pairs) or (S11: 1563 base pairs), or their complements;
- (3) purified **polypeptides** (IV) that comprise sequences (S2: 299 amino acids (aa)), (S4: 328 aa), (S5: 15 aa), (S6: 10 aa), (S7: 10 aa), (S8: 14 aa); (S10: 375 aa) or (S12: 422 aa), all (sic) with up to 20 conservative aa substitutions;
- (4) eliciting (M1) a proliferative response from monocytes, in animals that show a positive skin test, by administering Ag; and
 - (5) identifying (M2) the SOW gp58, gp66 and/or gp82 genes. ACTIVITY Fungicide.

No biological data given.

 ${\tt MECHANISM}$ OF ACTION - Induction of specific humoral and cellular immune responses.

Purified SOWgp58 from the Silveria isolate was tested in an essentially conventional proliferation assay (thymidine incorporation) against peripheral blood mononuclear cells. At a concentration of 50 micro g/ml in the cell culture medium it produced a stimulation index of 16, using cells from subjects who gave a positive skin test for C. immitis, but the index was only about 1 when using cells from subjects who gave a negative skin test.

- $\ensuremath{\mathsf{USE}}$ Spherical outer wall glycoproteins (SOW) are antigens useful for:
- (a) serodiagnosis of **coccidioidomycosis** (San Joaquin Valley fever); and
- (b) for stimulating proliferation of peripheral blood monocytes, for protection against this disease.
- (III) that encode SOW are useful as probes and primers for cloning, and as diagnostic probes. $\ensuremath{\mathsf{Dwg.0/9}}$

AB The vaccine efficacy of the gene sequence encoding the signal peptide of the antigen known as antigen 2 or proline-rich antigen (Ag2/PRA), an immunodominant antigen present in the cell wall of the fungal pathogen Coccidioides immitis, was investigated in a murine model of coccidioidomycosis. Expression plasmids for Ag2/PRA(1-18) DNA (signal sequence), Ag2/PRA(19-194) DNA (lacking the signal sequence), and Ag2/PRA(1-194) DNA (full length) were inserted in the pVR1012 vector, and the constructs were used to vaccinate the highly susceptible BALB/c mouse strain. Immunization with the signal gene sequence significantly reduced the fungal burden in the lungs and spleens of mice 12 days after intraperitoneal challenge with a lethal dose of 2,500 C. immitis arthroconidia, to a level comparable to the protection induced in mice immunized with the full-length Ag2/PRA(1-194) DNA. The Ag2/PRA(19-194) gene protected mice but to a significantly lower level than the signal sequence or the full-length Ag2 gene. The immunizing capacity of Ag2/PRA(1-18) was not attributable to a nonspecific immunostimulatory effect of DNA, as evidenced by the fact that mice immunized with a frameshift mutation of Ag2/PRA(1-18) were not protected against challenge. Furthermore, a synthetic peptide corresponding to the translated sequence of Ag2/PRA(1-18) DNA protected mice, albeit at a lower level than the Ag2/PRA(1-18) DNA vaccine. The protection induced with the signal gene vaccine correlated with the production of gamma interferon when splenocytes from Ag2/PRA(1-18)-immunized mice were stimulated with recombinant full-length Ag2 and was not associated with the production of anti-Coccidioides immunoglobulin G antibody. This is the first study to establish that a signal peptide sequence alone, administered as a gene vaccine or synthetic peptide, can induce protective immunity against a microbial pathogen.

NOVELTY - Methods for constructing fungal strains useful for identification and validation of gene products as target for therapeutic agents, for identifying and validating gene products as target for therapeutic agents, collections id identified genes and screening assays for the discovery of new drugs, are new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the following:

- (1) a method (I) of constructing a strain of diploid fungal cells (DFCs) in which both alleles (Als) of a gene are modified and for assembling a collection of DFCs each of which comprises modified Als of a different gene;
- (2) a strain of DFCs comprising modified Als of a gene, wherein the first Al of the gene is inactivated by **recombination** using a gene disruption cassette comprising a nucleotide (Nt) sequence (seq) encoding an expressible selectable marker and the expression of the second Al of the gene is regulated by a heterologous promoter that is operably linked to the coding region of the second Al of the gene;
- (3) a collection (III) of diploid fungal strains (II) in which each strain comprises modified Als of a different gene, and all the different genes in the genome of the fungus are modified and represented in the collection;
- (4) a NAM microarray (IV) comprising a plurality of nucleic acid molecules (NAMs) (each NAM comprises a Nt seq that is hybridizable to a target Nt seq selected from 62 defined seqs given in the specification, a Nt seq that is hybridizable to the Nt seq of a gene that is either essential to the growth of a DFC or contributes to the virulence and/or pathogenicity of the DFCs against a host organism;
- (5) a method (V) for identifying a gene that is essential to the metabolism/life cycle of a fungus comprising:

- (a) culturing the DFCs (II) under conditions in which the second Al of the gene is substantially under expressed (expd) or not expd; and
- (b) determining:
- (i) viability of the cells (a loss or reduction of viability as compared to a control indicates that the modified gene is essential to the survival of the fungus);
- (ii) growth of the cells (a loss or reduction of growth of the cells as compared to a control indicates that the modified gene is essential to the growth of the fungus);
- (iii) growth of the cells (a loss or reduction of growth of the cells as compared to a control indicates that the modified gene is essential to the growth of the fungus);
- (iv) viability of the cells (an increase in viability as compared to a control indicates that the modified gene contributes to the resistance of the diploid fungus to the antifungal agent);
- (6) a method (VI) for identifying an antifungal agent that inhibits the growth of a diploid fungus;
- (7) a method (VII) for identifying a therapeutic agent for treatment of a mammalian disease;
- (8) a method (VIII) for correlating changes in the levels of **proteins** with the inhibition of growth or proliferation of a DFC, comprising:
- (a) generating a first protein expression profile for a control DFC which comprises two wild type Als of the gene;
- (b) culturing DFCs (II) under conditions wherein the second Al of the gene is substantially under expd, not expd or over expd, and generating a second **protein** expression profile for the cultured cells; and
- (c) comparing the first protein expression profile with the second protein expression profile to identify changes in the levels of proteins;
- (9) a method (IX) for correlating changes in the levels of gene transcripts with the inhibition of growth or proliferation of a DFC, comprising:
- (a) generating a transcription profile for a control DFC which comprises two wild type Als of the gene;
- (b) culturing DFCs (II) under conditions wherein the second Al of the gene is substantially under expd, not expd or over expd and generating a second transcription profile for the cultured cells; and
- (c) comparing the first transcription profile with the second transcription profile to identify changes in the levels of gene transcripts;
- (10) a NAM (X) comprising a Nt seq encoding a gene product required for proliferation of Candida albicans (the gene product comprises a defined amino acid seq given in the specification);
- (11) a NAM (XI) comprising a fragment of comprising at least 10 to 100 consecutive Nts; a NAM comprising a Nt seq that hybridizes under stringent condition to a second NAM consisting of:
- (a) a Nt seq selected from the seqs given in the specification; or $% \left(\frac{1}{2}\right) =\frac{1}{2}\left(\frac{1}{2}\right) +\frac{1}{2}\left(\frac{1}{2}\right) +\frac{1}{2}\left$
- (b) a Nt seq that encodes a **polypeptide** comprising an amino acid seq defined in the specification (the stringent conditions comprises hybridization to filter-bound DNA in 6 multiply sodium chloride sodium citrate (SSC) at about 45 deg. C followed by one or more washes in 0.2 multiply SSC/0.1 % sodium dodecyl sulfate (SDS) at about 50-65 deg. C);

- (12) a NAM (XII) obtained from an organism other than Candida albicans or Saccharomyces cerevisiae comprising a Nt seq having at least 30% identity to a defined seq given in the specification, fragments of at least 25 consecutive Nts, and/or seqs complementary to them as determined using BLAST-N version 2.0 with the default parameters;
- (13) a **vector** (XIII) comprising a promoter operably linked to the NAMs above;
 - (14) a host cell (XIV) containing the vector (XIII);
- (15) a polypeptide (XV) comprising a defined amino acid seq given in the specification;
- (16) a polypeptide (XVI) obtained from an organism other than Candida albicans or Saccharomyces cerevisiae comprising an amino acid seq having at least 30% similarity to an amino acid seq defined in the specification as determined using FASTA version 3.0t78 with the default parameters;
- (17) a fusion protein (XVII) comprising a fragment of a polypeptide fused to a second polypeptide (the fragment comprises at least 6 consecutive residues of a defined amino acid seq given in the specification;
- (18) a method (IXX) of producing a polypeptide, comprising introducing into a cell, a vector comprising a promoter operably linked to a Nt seq encoding a polypeptide comprising a defined amino acid seq given in the specification and culturing the cell so that the Nt seq is expd; and
- (19) a method (XX) of producing a polypeptide, comprising providing a cell which comprises a heterologous promoter operably linked to a Nt seq encoding a polypeptide comprising a defined amino acid seq given in the specification and culturing the cell so that the Nt seq is expd.

Note: Other INDEPENDENT CLAIMS are included but have had to be omitted due to lack of space.

USE - The methods are used to identify agents that may be used in the treatment of fungal infections. $\ensuremath{\mathsf{Dwg.0/6}}$

Coccidioides immitis antigens which stimulate a T helper AΒ cell 1 (Th1) pathway of host immune response are considered to be essential components of a vaccine against coccidioidomycosis Recombinant urease (rURE) and recombinant heat shock protein 60 (rHSP60) of C. immitis were expressed in Escherichia coli and tested as vaccine candidates in BALB/c mice. A synthetic oligodeoxynucleotide which contained unmethylated CpG dinucleotides and was previously shown to enhance a murine Th1 response was used as an immunoadjuvant. T cells isolated from the spleens and lymph nodes of the rURE- and rHSP60-immune mice showed in vitro proliferative responses to the respective recombinant protein, but only those T lymphocytes from rURE-immunized mice revealed markedly elevated levels of expression of selected Th1-type cytokine genes. BALB/c mice immunized subcutaneously with rURE and subsequently challenged by the intraperitoneal (i.p.) route with a lethal inoculum of C. immitis arthroconidia demonstrated a significant reduction in the level of C. immitis infection compared to control animals. rHSP60 was much less effective as a protective antigen. Evaluation of cytokine gene expression in lung tissue and levels of recombinant urease-specific immunoglobulins (immunoglobulin G1 [IgG1] versus IgG2a) in murine sera at 12 days after challenge provided additional evidence that immunization with rURE stimulated a Th1 response to the pathogen. Urease was further evaluated by expression of the URE gene in a mammalian plasmid vector (pSecTag2A.URE) which was used to immunize mice by the intradermal route. In this case, 82% of the vector construct-immunized animals survived more than 40 days after i.p. infection, compared to only 10% of the mice immunized with the vector alone. In addition, 87% of the pSecTag2A.UREimmunized survivors had sterile lungs and spleens. These data support the need for further evaluation of the C. immitis urease as a candidate vaccine against coccidioidomycosis.

AB We have previously cloned and expressed a major parasitic cell surface antigen (SOWgp) of C. immitis which, upon immunization elicits both antibody and T cell responses in BALB/c mice. Our data also showed that the recombinant SOWgp has high affinity for laminin and fibronectin of the extracellular matrix (ECM). To confirm that the SOWgp functions as an adhesin, the SOWgp gene was deleted by a double, locus-specific crossover event. This resulted in replacement of 1.8-kb fragment of the SOWgp gene with a 3.6-kb DNA construct that encodes a hygromycin resistant gene from the pAN7.1 vector. Results of PCR analysis, Southern hybridization, and immunoblot assays of parasitic cell homogenates of the Dsowgp mutant compared to the parental strain confirmed that the SOWgp gene was replaced and the antigen was no longer produced. This is the first report of a successful targeted gene knockout of C. immitis using the double crossover strategy. Comparative immunoelectron-microscopic examinations of the isolated, crude outer parasitic cell wall fraction of the DELTAsowqp and parental strains showed total loss of patient antibody reactivity with the former. The DELTAsowqp parasitic cells showed 20-50% reduction in their ability to bind to human and murine ECM. Virulence studies of the DELTAsowgp strain in intranasally-challenged BALB/c mice showed 20% survival compared to none in the case of mice challenged with the parental strain. It is apparent that deletion of SOWgp production did not eliminate the ability of the pathogen to cause disease. Preliminary investigations of the influence of recombinant SOWqp on immune murine T cells in vitro suggested that the protein stimulates a dominant Th2 response, demonstrated by elevated levels of IL-5 production. Our hypothesis is that SOWqp has a major impact on disseminated coccidioidal infection by compromising the host immune pathway toward a detrimental Th2 response.

AB Early studies have demonstrated the significance of the interplay between Coccidioides immitis and macrophages during coccidioidomycosis. In this study we report the

purification of a ligand expressed at the surface of endospores of

C. immitis which binds to an unknown receptor of a murine macrophage line (IC-21). Cell wall proteins of different stages of the parasitic cycle were labeled with biotin and subjected to beta-mercaptoethanol extraction. A single macrophage plasma membrane binding protein (MBP) with molecular size of 36-kDa was isolated from the endospore extract. The C. immitis MBP was purified and two internal peptides of the trypsin-digested fraction were sequenced. Degenerate primers were designed to PCR amplify a fragment of the MBP gene, and the PCR product was then used to screen a C. immitis genomic library for isolation of the full-length gene. The MBP gene is characterized by an open reading frame of 638 bp, and does not contain any introns. The MBP gene was subcloned into the pET28b expression vector and the recombinant, histidine-tagged fusion protein (rMBP) was produced by transformed E. coli stain BL21(DE3). The rMBP was shown to bind to the surface of both IC-21 cells and resident murine peritoneal macrophages. An in vitro study of temporal expression of the MBP gene during the parasitic cycle was conducted by RT-PCR and Northern blot analyses, and showed that maximum expression occurs at the endosporulation stage. Polyclonal antibody raised in guinea pigs against the rMBP was used for immunoblot analyses of beta-mercaptoethanol extracts of intact parasitic cells, as well as total cell homogenates of the saprobic and parasitic phases of C. immitis. The results showed that the rMBP was present only in beta-mercaptoethanol extracts and homogenates of first generation round cells and endospores. suggest that the newly-isolated MBP of C. immitis plays a pivotal role in the course of coccidioidal infections:

NOVELTY - Novel human chitinase **polypeptide** and polynucleotide fragments have chitin-binding activity but lack chitinase enzymatic activity.

DETAILED DESCRIPTION - A chitin-binding, chitinase-inactive polypeptide (I) comprises a chitin-binding fragment of the 54 C-terminal amino acids (aa) of human chitinase having a 466 aa sequence (S1) (given in the specification).

INDEPENDENT CLAIMS are also included for the following:

- (1) a chitin-binding, chitinase-inactive polypeptide comprising as residues X-Y of (S1), where X is a consecutive integer from 347 to 397 and Y is 445;
- (2) a fusion protein comprising (I) fused to a heterologous polypeptide (e.g. an enzyme);
- (3) a composition comprising (I) and a diluent, optionally further comprising a non-chitinase anti-fungal agent;
- (4) a composition comprising (I) or the fusion protein of (1) conjugated to an anti-fungal agent;
- (5) treating fungal infection, comprising administering to a subject suffering from fungal infection the composition of (3) or (4), optionally further comprising administering a non-chitinase anti-fungal agent;
- (6) a composition comprising (I) or the fusion protein of (1) conjugated to a detectable label, especially radioisotopes, fluorophores, dyes, electron-dense compounds or enzymes;
- (7) determining the presence of chitin in a sample, comprising contacting the sample with the composition of (6), and determining the amount of labelled polypeptide bound to chitin;
- (8) a purified, isolated polynucleotide (especially DNA) encoding (I);
 - (9) a vector comprising the DNA of (8);
- (10) a host cell stably transformed or transfected with the DNA of (8) in a manner allowing the expression of (I), and
- (11) a monoclonal antibody that specifically binds to an epitope within the 54 C-terminal amino acids of human chitinase having a sequence (S1).

ACTIVITY - Chitin-binding.

MECHANISM OF ACTION - None given.

USE - Chitinase fragments can be used to screen for proteins or other molecules that specifically bind to the chitin-binding domain of human chitinase or that modulate its activity. These compounds are useful for immunization, as well as for purifying chitinase, as well as for detection and quantification of chitinase. Polynucleotide fragments of the invention are useful as a source of probes and primers, and to express the proteins recombinantly. The chitinase fragments, when conjugated to antifungal compounds, are used to treat animals, especially humans, infected with chitin-containing parasites such as fungi. Fungal infection treated include candidiasis, aspergillosis, coccidioidomycosis, blastomycosis, paracoccidioidomycosis, mucormycosis, histoplasmosis, cryptococcosis, chromoblastomycosis, sporotrichosis, and dermatophytoses.

ADVANTAGE - Chitin can be degraded by the enzyme chitinase. Use of whole chitinase protein for treating infections, especially fungal infections, is problematic. In view of the increasing incidences of life- threatening fungal infection in e.g. immunocompromised individuals, there exists a need fro identifying new compounds for treating fungal infection. The chitin-binding fragments of the present invention provide this need. Dwg.0/0

AB In previous work, antibodies in serum samples from patients with coccidioidomycosis were found to react with a proline-rich antigen (PRA) isolated from spherules of Coccidioides immitis, and the gene encoding this antigen was cloned. expressed and purified recombinant PRA (rPRA) by removing the majority of amino acids contributed by the vector from the fusion protein. Purified rPRA reacted with serum IgG antibodies in 37 of 42 patients with culture-proven progressive pulmonary or extrapulmonary coccidioidal disease; specific antibodies in dilutions ranging from 1:40 to 1:102,400 were demonstrated (sensitivity, 88%). In contrast, for > 95% of patients without coccidioidomycosis reactivity of < 1:40 was demonstrated (specificity, 97%). Of 18 patients with primary self-limited coccidioidomycosis, none had detectable antibodies in serum samples collected up to 141 days after illness began. The association of antibodies to rPRA with progressive infection may have prognostic value.

The urease (URE)-encoding gene from Coccidioides immitis (Ci), a respiratory fungal pathogen of humans, was cloned, sequenced, chromosome-mapped and expressed. Both the genomic and cDNA sequences are reported. The transcription start point and poly(A)-addition site were confirmed. The URE gene contains eight introns and a 2517-bp ORF that translates a 839-amino-acid (aa) protein of 91.5 kDa and pI of 5.5, as deduced by computer

analysis of the nucleotide sequence. The translated **protein** revealed eight putative N-glycosylation sites. The deduced URE showed comparable levels of homology to reported URE of the jack bean plant (Canavalia ensiformis; 71.8%) and URE of several genera of bacteria (Bp, 71.7%; Hp, 68.3%; Ka, 71.6%; Pm, 71.9%). The URE gene was mapped to chromosome III of Ci and was shown to be a single copy gene by Southern hybridization. Expression of a 1687-bp fragment of the URE gene in E. coli resulted in the production of a 63-kDa **recombinant protein** that was recognized in an immunoblot by antiserum raised against the Ka URE homolog. This is the first report of a fungal URE gene.

Previous experiments have provided evidence that AB Coccidioides immitis antigen 2 (Ag2) is a major T-cell-reactive component of mycelia and spherule cell walls. we report the identification and cloning of the cDNA that encodes Ag2 from a lambda ZAP cDNA expression library constructed from spherule-derived RNA. DNA sequence analysis established that the 1,255-bp clone contains a 174-bp 5' untranslated region, a 582-bp open reading frame which encodes for a protein consisting of 194 amino acids, and a 375-bp 3' untranslated region, including a poly(A) tail. The recombinant Ag2 protein has a predicted molecular mass of 19.5 kDa and contains an 18-amino-acid N terminus which has been tentatively identified as a signal peptide. The Ag2 cDNA was ligated into the pGEX-4T-3 vector and expressed in Escherichia coli TG-1 cells as a glutathione S-transferase fusion protein. The recombinant fusion protein showed reactivity with sera from patients with coccidioidomycosis and elicited delayed-type footpad hypersensitivity responses in Coccidioides-immune mice. These results suggest that the Aq2 cDNA can be used for the large-scale production of this immunologically important protein.

AB Detection of anti-Coccidioides complement-fixing (CF) antibody is a valuable diagnostic and prognostic aid in coccidioidomycosis. The CF antibody response is directed against a heat-labile antigen that has chitinase activity, hereafter referred to as the CF/chitinase protein. To identify and clone this immunoreactive enzyme, we constructed a Coccidioides immitis cDNA lambda ZAP expression library from spherule RNA and detected fusion peptides expressing CF epitopes by inmunoscreening. A cDNA clone consisting of 1,623 bp was identified, sequenced, and found to contain a single open reading frame that encodes a protein of 47 kDa with 427 amino acids. Deduced amino acid sequence analyses showed that the cloned CF/chitinase cDNA contains a 35-amino-acid region, beginning at Ser-18 and ending at and ending at Arg-52 which has 92% homology with the reported N-terminal amino acid sequence of authentic CF/chitinase protein. The first 17 amino acids in the deduced sequence of the cloned cDNA are not present on the mature CF/chitinase protein, suggesting that it may be a signal peptide. Expression of the CF/chitinase cDNA insert by using the pGEX-4T-3 vector yields a fusion peptide that bears CF-specific epitopes and shows chitinase activity. CF/chitinase clone will enable large-scale production of the recombinant CF antigen for use in immunoassays and facilitate studies on the role of chitinase in the morphogenesis of

AB Results of earlier investigations have indicated that the saprobic phase of Coccidioides immitis produces a heat-stable, 19-kDa antigen with serine proteinase activity which has been suggested to be specific for this pathogenic fungus. In the present study we have determined the N-terminal and partial internal amino acid sequences of the purified, 19-kDa antigen, cloned the gene which encodes this polypeptide, and confirmed that the secreted proteinase is a Coccidioides-specific antigen (CS-Ag). Both the genomic and cDNA sequences are reported and reveal that the csa gene which encodes this antigen has no introns. A 543-bp open reading frame encodes a 181-amino-acid-containing protein with a predicted molecular mass of 19.8 kDa and an isoelectric point of 8.3. The csa gene was localized on chromosome I of three representative C. immitis clinical isolates on the basis of Southern hybridizations. Expression of the csa gene in Escherichia coli using the pET21a plasmid vector yielded a recombinant protein that was recognized in immunoblot assays by antibody raised to the purified 19-kDa CS-Ag. Secretion of the native antigen is suggested to occur by cleavage of a putative 23-residue signal **peptide**. The native CS-Ag showed a low degree of glycosylation. Analysis of the carbohydrate composition of the CS-Ag revealed xylose, mannose, galactose, and glucose. However, the purified antigen showed no affinity for concanavalin A. A PCR method with specificity and high sensitivity for detection of C. immitis genomic DNA, using a pair of synthetic oligonucleotide primers whose sequences were based on that of the csa gene, was developed. A 520-bp product was amplified only when C. immitis genomic DNA was used as the template. The lower limits of DNA detection using this PCR method were 1 pg of C. immitis genomic DNA by ethidium bromide staining and 100 fg after Southern hybridization. The csa gene-based PCR method for detection of C. immitis DNA is useful for culture identification and may have clinical applications for the diagnosis of coccidioidal infections.

AB T-cell mediated immune response to coccidioidomycosis has been shown to be the principal mechanism of resistance to this respiratory fungal disease in experimental animals. In this study, a Coccidioides immitis antigen-specific murine T-cell line was used to identify macromolecules capable of eliciting an immune mouse T-cell proliferative response. The murine T-cell line was selected on the basis of its strong positive response to a soluble conidial wall fraction (SCWF), which had previously been shown to be reactive in humoral and cellular immunoassays. An antigen-specific T-cell line rather than T-cell clones was used to identify multiple antigens. The T-cell immunoblot method was employed first to identify immunoreactive sub-fractions of the SCWF, and then to identify T-cell fusion proteins (FPs) obtained from a cDNA expression library constructed in lambda gtll. The library was screened with anti-SCWF. The nucleotide sequence of a 0.2 kilobase cDNA insert encoding a FP which elicited vigorous T-cell response was determined. A construct of this insert was subcloned into the pET expression vector system and 6.5-kilodalton (kDa) recombinant protein (RP) expressed in Escherichia coli was isolated. The RP and FP were shown to be homologous on the basis of identify of their amino acid sequences. Antibody raised in guinea pigs against the RP recognized a 59-kDa native protein of the mycelial culture filtrate produced by three separate strains of C. immitis, and reacted with the cell wall of arthroconidia as detected by immunofluorescence microscopy. In this study we have identified and partly characterized a potentially important T-cell stimulating antigen of C. immitis.

- SO INFECTION AND IMMUNITY, (2002 Jul) 70 (7) 3330-5. Journal code: 0246127. ISSN: 0019-9567.
- AB Subunits of a proline-rich coccidioidal antigen (Ag2/PRA) of Coccidioides immitis were analyzed by comparison as vaccines in mice. The optimal dose of plasmid vaccine encoding full-length Ag2/PRA was determined to be between 10 and 100 microg. Mice vaccinated with plasmids encoding amino acids (aa) 1 to 106 were as protective as full-length Ag2/PRA (aa 1 to 194). The subunit from aa 27 to 106 was significantly but less protective. Plasmids encoding aa 90 to 151 or aa 90 to 194 were not protective. Analogous results were obtained with recombinant vaccines of the same amino acid sequences. In addition, mixtures of aa 90 to 194 with either aa 1 to 106 or aa 27 to 106 did not enhance protection compared to the active single-recombinant subunits alone. Humoral

response of total immunoglobulin G (IgG) and subclasses IgG1 and IgG2a were detectable in subunit vaccinations but at significantly (100-fold) lower concentrations than after vaccination with plasmids encoding full-length Ag2/PRA. Since virtually all protection by vaccination with full-length Ag2/PRA can be accounted for in the first half of the protein (aa 1 to 106), this subunit could make a multicomponent vaccine more feasible by reducing the quantity of protein per dose and the possibility of an untoward reactions to a foreign protein.

- A proline rich antigen (PRA), which protects mice against AB Coccidioides immitis, has been analyzed for differential expression and variation among isolates. Northern blots of RNA from different stages of growth were probed with previously cloned cDNA and showed that mRNA for PRA increased as spherules transformed and matured from mycelia. This pattern corresponds to the relative potency of whole cell vaccines from similar preparations. The PRA gene was then cloned from a genomic library of the Silveira strain of C. immitis and its sequence analyzed. Eight other coccidioidal isolates, selected for diversity in geographic origin and resulting clinical disease, demonstrated heterogeneity in Southern blots and in sequences of polymerase chain reaction products. Silveira differed from other California isolates at 33 of 555 bases, whereas it differed from non-California isolates by <=2 bases. Only one of these substitutions affected protein sequence. Thus, tests or vaccines based on this gene are likely to cover most isolates.

- AB We have cloned and sequenced the cDNA encoding an immunoreactive protein from the pathogenic fungus Coccidioides immitis which stimulates human T cells and has been associated with protective vaccines in mice. The transcript contained an open reading frame encoding 194 amino acids with a calculated molecular weight of 19.5 kDa, a 151 base 5' untranslated region (UTR), and a 468 base 3'UTR. A four member repeat motif, usually thr-ala-glu-pro, exists for amino acids 98 through 141. Deduced amino acid sequence derived from the cDNA was identical with previously determined internal amino acid sequence from the native protein, and goat antiserum raised against the purified fungal protein reacted with an inducible fusion protein translated from this cDNA. Using this cDNA to produce recombinant protein will allow direct testing of its role in human immunity to coccidioidomycosis and may lead to new diagnostic

tests.

- AB Cilofungin, a new antifungal drug, was found to inhibit mycelial growth of Coccidioides immitis. Light and electron microscopic observations indicated delay in development of the outer hyphal wall. Cilofungin also blocked incorporation of the chitin substrate, N-acetylglucosamine, into mycelia. However, when C. immitis was grown under conditions that induced spherule development, drug effects were dramatically decreased. Furthermore, efficacy of cilofungin in treatment of murine coccidioidomycosis could not be demonstrated. These studies indicate that glucan-synthase inhibitors have activity against C. immitis, and other compounds with different pharmacologic properties or in combination with other antifungal drugs may exploit this biologic effect.

AB The present invention relates to a Candida albicans gene (CSA1) encoding a surface protein. The present invention also relates to the surface protein and methods for using the protein or the gene for the detection, prophylaxis or treatment of candidal infection. The protein encoded is a surface antigen of Candida albicans yeast and mycelial forms, respectively. The mycelial surface antigen was shown to be present predominantly in the terminal third of the hyphal structures. CSA1 is a gene coding for a unique surface antigen.

PUBLISHER: Journal DOCUMENT TYPE: LANGUAGE: English Coccidioides immitis is a fungal pathogen of humans and is classified as a Select Agent. We have identified a new potential vaccine candidate for this pathogen using cDNA expression library immunization (ELI). A C. immitis spherule-phase cDNA library containing 800-1000 genes was divided into 10 pools and each was tested for its protective capacity in BALB/c mice against i.p. challenge with 2500 arthroconidia of this dimorphic fungus. The most protective pool, designated Pool 7, was fractionated into five sublibraries, each containing 60 genes, and of these, only Pool 7-3 induced a significant level of protection in mice. Fractionation of Pool 7-3 into six sublibraries, each with 10 genes, yielded a protective fraction, designated Pool 7-3-5. Subsequent fraction of the latter pool into 10 sublibraries, each with one clone, yielded a clone designated 7-3-5-5 that was highly protective. Clone 7-3-5-5 was sequenced and found to contain a 672 bp ORF encoding a 224 amino acid protein having a 19 amino acid signal sequence on the N-terminus and a 15 amino acid C-terminal GPI anchor site. 7-3-5-5 clone, designated ELI-Antigen 1 (ELI-Aq1), showed partial homol. with a hypothetical protein from Neurospora crassa. This is the first study to identify a protective antigen from a fungus using ELI, and it is also the first report in which sequential fractionation of an expression library successfully identified a single protective gene. LANGUAGE: English Dendritic cells are the most potent antigen-presenting cells that

initiate and modulate the host immune system. Based on their immunostimulatory activity, a variety of strategies have been developed to use dendritic cells as vaccines and immunotherapeutic agents against infection and cancer. Genetically modified dendritic cells are useful for immunotherapeutic purposes because of their sustained activity in vivo. However, transfection of dendritic cells with plasmid DNA has been very difficult. While the viral transfection is associated with nonspecific activation of dendritic cells, commonly used nonviral transfection reagents have a low efficiency of transfection. Here we describe an improved, simple, less time-consuming transfection protocol using the nonviral nonliposomal lipid polymer, TransIT-TKO transfection reagent, for transfecting murine dendritic cells (JAWS II) with the gene that encodes Coccidioides immitis antigen 2 (Ag2). The JAWS II cells were cotransfected with pHYG-enhanced green fluorescent protein (EGFP) and pVR1012-C immitis Ag2

plasmid DNAs using TransIT-TKO reagent. We reproducibly obtained 30%-50% transfection efficiency. The transfected cells maintained their immature phenotype and were functionally active. In addition, the flexibility of this agent for expressing multiple antigens (GFP and C. immitis Ag2) offers an advantage of

delivering multiple immunogens.

English LANGUAGE:

The vaccine efficacy of the gene sequence encoding the signal peptide of the antigen known as antigen 2 or proline-rich antigen (Ag2/PRA), an immunodominant antigen present in the cell wall of the fungal pathogen Coccidioides immitis, was investigated in a murine model of coccidioidomycosis. Expression plasmids for Ag2/PRA(1-18) DNA (signal sequence), Ag2/PRA(19-194) DNA (lacking the signal sequence), and

Ag2/PRA(1-194) DNA (full length) were inserted in the pVR1012 vector, and the constructs were used to vaccinate the highly susceptible BALB/c mouse strain. Immunization with the signal gene sequence significantly reduced the fungal burden in the lungs and spleens of mice 12 days after i.p. challenge with a LD of 2500 C. immitis arthroconidia, to a level comparable to the protection induced in mice immunized with the full-length Ag2/PRA(1-194) DNA. The Ag2/PRA(19-194) gene protected mice but to a significantly lower level than the signal sequence or the full-length Ag2 gene. The immunizing capacity of Ag2/PRA(1-18) was not attributable to a nonspecific immunostimulatory effect of DNA, as evidenced by the fact that mice immunized with a frameshift mutation of Ag2/PRA(1-18) were not protected against challenge. Furthermore, a synthetic peptide corresponding to the translated sequence of Ag2/PRA(1-18) DNA protected mice, albeit at a lower level than the Ag2/PRA(1-18) DNA vaccine. The protection induced with the signal gene vaccine correlated with the production of gamma interferon when splenocytes from Ag2/PRA(1-18)-immunized mice were stimulated with recombinant full-length Ag2 and was not associated with the production of anti-Coccidioides IgG antibody. is the first study to establish that a signal peptide sequence alone, administered as a gene vaccine or synthetic peptide, can induce protective immunity against a microbial pathogen.

AR Coccidioides immitis is a dimorphic fungus of the American southwest growing in the soil as mycelia and within the host as the spherule/endospore parasitic phase. We hypothesized that genes that are upregulated when C. immitis grows in vivo might be associated with virulence of this primary fungal pathogen. To identify potential virulence-associated genes, we utilized differential display, reverse transcriptase, polymerase chain

reaction (DD-RT-PCR) to assess induction of gene expression within C. immitis spherules during intracellular parasitism of murine macrophages. Macrophage monolayers were infected with C. immitis arthroconidia and, after approximately 36 hours of culture, RNA was obtained from the developing macrophage-derived spherules and compared to RNA from spherules grown in tissue culture medium alone. Differential display analyses identified 11 gene fragments specific for the macrophage-derived spherules. These products were cloned into a TA vector, sequenced, and analyzed for homology with the Genbank databases. One clone had significant homology to a Magnaporthe grisea appressorium stage cDNA library gene and Saccharomyces cerevisae glycogen phosphorylase. The complete cDNA clone was recovered using 5' and 3' RACE and using this as a probe, we obtained and sequenced a genomic clone for C. immitis glycogen phosphorylase. The gene had seven predicted introns and a translation of the coding region indicated that the protein would contain 881 amino acids with a molecular weight of 100.6 kDa and a pI of 5.75. Northern analysis confirmed that glycogen phosphorylase message was differentially expressed by spherules in parasitized macrophages. Differential display may provide a tool to delineate virulence-associated genes of C. immitis or help define metabolic targets for rationally designed antifungal drugs.

AB The x-ray crystal structure of chitinase from ${\bf C}$.

immitis was solved to 2.2 Å resolution. Like other members of the class 18 hydrolase family, this 427-residue protein was an 8-stranded β/α -barrel. Although lacking an N-terminal chitin-anchoring domain, the enzyme closely resembled chitinase from Serratia marcescens. Among the conserved features

were 3 cis **peptide** bonds, all involving conserved active site residues. The active site was formed from conserved residues such as Trp-47, Trp-131, Trp-315, Trp-378, Tyr-239, Tyr-293, Arg-52 and Arg-295. Glu-171 was the catalytic acid in the hydrolytic mechanism; when it was mutated to Gln, enzyme activity was abolished. Allosamidin is a substrate analog that strongly inhibits the class 18 enzymes. Its binding to the chitinase, hevamine, was

previously observed and conserved structural features of the 2 enzymes were used to predict the inhibitor's binding to the fungal enzyme.

LANGUAGE: English SUMMARY LANGUAGE: English

T-cell-mediated immunity is an important determinant in protection

against primary infection with Coccidioides immitis, a dimorphic fungal pathogen that causes the disease

coccidioidomycosis. To determine if interleukin-12 (IL-12) gene therapy could potentiate host response against C.

immitis, we constructed a single-chain cDNA encoding the p40 and p35 subunits linked by a polylinker and, using a retroviral vector, transfected J774 macrophages with the construct. The

transduced J774 cells expressed IL-12 in vitro, with a mean concentration of 28,440 pg from 106 cells in 48 h as measured by an IL-12 (p75)-specific enzyme-linked immunosorbent assay. The secreted IL-12 was biologically active, as judged by its ability to induce the production of gamma interferon (IFN- γ) by spleen cells

from BALB/c mice. Treatment of the highly susceptible BALB/c mouse

strain with the IL-12- transduced J774 cells inhibited C.

immitis growth in tissues from mice challenged by a pulmonary route, as evidenced by 1.37-, 2.59-, and 1.22-log

reductions in the number of CFU in the lungs, spleens, and livers,

respectively, compared to the fungal load in mice given

vector-transduced J774 cells. The protective effect of IL-12 gene therapy was accompanied by increased levels of IFN- γ in the

lungs and sera of mice treated with IL-12- transduced J774 cells and

the constitutive production of IFN- γ by their spleen cells

cultured in vitro. These results suggest that IL-12 gene therapy could be used as adjunct therapy for coccidioidomycosis.

AB Previous studies from our laboratory established that C-ASWS, an alkali-soluble, water-soluble extract from cell walls of **Coccidioides** immitis, protects mice against lethal challenge with this fungus.

The C-ASWS extract contains a glycosylated protein,

designated antigen 2 (Ag2), and a polysaccharide antigen. We recently cloned Ag2 cDNA and showed that the recombinant fusion

protein elicited strong delayed-type hypersensitivity

responses in immunized mice. This investigation was undertaken to determine if the recombinant Ag2 protein, expressed as an

Ag2-glutathione S-transferase (GST) fusion **protein**, or Ag2 cDNA would protect mice against lethal challenge with **C**.

immitis. The recombinant Ag2-GST protein

protected BALB/c mice against i.p. challenge with 250 arthroconidia,

as assessed by a decrease in fungal CFU in tissues. The

Ag2-GST-immunized mice did not show, however, an increased survival during a 30-day period postinfection. By contrast, immunization of mice with Ag2 cDNA ligated into the pVR1012 plasmid engendered protection against i.p. challenge with 2,500 arthroconidia and

against pulmonary challenge with 50 arthroconidia. Vaccine efficacy

paralleled the development of delayed-type hypersensitivity

responses to C. immitis antigen. Whereas mice

vaccinated with the recombinant Ag2-GST protein did not

mount footpad hypersensitivity to C-ASWS or the recombinant Ag2-GST

protein, mice vaccinated with the pVR1012-Ag2 construct

mounted a strong footpad hypersensitivity and their spleen cells

secreted gamma interferon upon in vitro stimulation with the

Ag2-containing C-ASWS extract This is the first investigation to show that

genetic immunization can protect against lethal challenge with

C. immitis.

LANGUAGE: English

The authors have previously cloned the cDNA fragment that encodes the complement fixation antigen of Coccidioides immitis. The recombinant protein was highly sensitive in detecting CF antibody in sera from patients with coccidioidomycosis but was not specific to C. immitis, as evidence by its reactivity with sera from patients with histoplasmosis and, to lesser extent, blastomycosis. The authors undertook this study to determine if the epitope(s) that reacts with CF antibody is the same or differs from the epitopes that are shared with Histoplasma capsulatum and Blastomyces dermatitidis. PCR-generated CF/chitinase cDNA fragments were cloned and examined for their reactivity in enzyme-linked immunosorbent assays using sera from patients with coccidioidomycosis, histoplasmosis, or blastomycosis. A peptide domain comprised of amino acid residues 20 through

310 was shown to express an epitope(s) that is specific to anti-Coccidioides CF antibody. The peptide detected serum antibody in 21 (95%) of 22 patients with active coccidioidomycosis and was without reactivity with sera from 20 patients with histoplasmosis, 15 patients with blastomycosis, and 14 healthy subjects. Antibody titers to the recombinant peptide directly correlated with CF antibody titers (P < 0.01), and preadsorption of reference CF antiserum with the peptide ablated the reactivity of the antiserum in the immunodiffusion assay for CF antibody. The delineation of a recombinant peptide that has both sensitivity and specificity will provide a valuable tool for detecting CF antibody

and for evaluating the role of CF antibody in the host response to

Journal

English LANGUAGE:

Antigen 2 (Ag2), a major immunoreactive component of C. immitis mycelium- and spherule-phase cell walls, was recently cloned and was shown to elicit T-cell responses in Coccidioides-immune mice. Here, the authors evaluated

recombinant Ag2 (rAg2) and PCR-generated Ag2 truncations for expression of B-cell-reactive epitopes in ELISA and immunoblot

assays with sera from patients with active

coccidioidomycosis, a hyperimmune goat anti-Ag2 serum, and a murine anti-Ag2 monoclonal antibody that recognizes a conformational epitope. The results established that rAg2 expresses both linear and conformational B-cell-reactive epitopes which are localized to a domain comprised of amino acids 19-96 (designated A19-96).

Truncations designed to identify epitopes within the A19-96 domain yielded fragments that either were nonreactive (A62-194, A19-61, and A49-79) or showed reduced reactivity (A19-79). Hence, A19-96 was the shortest domain expressing epitopes recognized by the panel of

antibodies. The prevalence of antibodies to the A19-96 domain was evaluated in ELISAs of sera from 28 coccidioidomycosis

patients. Antibody reactivity was detected in 79% of the patients' sera, and the level of antibody reactivity was directly correlated with disease severity. Whereas patients with pulmonary disease showed a mean response (A405) of 0.16, patients with disseminated

coccidioidomycosis showed a mean response of 0.69. No reactivity was detected with sera from histoplasmosis or

blastomycosis patients. The production of a recombinant peptide that expresses C. immitis-specific Ag2 epitopes

provides a useful reagent for examining the role of anti-Ag2 antibodies in coccidioidomycosis.

AB We undertook an investigation to assess the utility of a recombinant

Coccidioides immitis complement-fixing (CF) antigen for

detecting CF antibody in sera from patients with coccidioidomycosis. Enzyme-linked immunosorbent assays established that recombinant CF antigen and, for comparison, a commercially available coccidioidin were reactive with 19 of 19 sera from patients with active coccidioidomycosis. The recombinant antigen was significantly more sensitive than coccidioidin. The median titer obtained when patients' sera were assayed against recombinant CF antigen was 1:51,200 compared to 1:25,600 with coccidioidin (P < 0.027). The recombinant antigen was also more effective in distinguishing the antibody levels in sera from patients with pulmonary coccidioidomycosis than in sera from those with disseminated disease. Whereas patients with pulmonary disease showed a median antibody titer of 1:25,600, those with multifocal disease showed a median titer of 1:102,400 (P < 0.028). The recombinant CF antigen was found, however, to express an epitope(s) that reacted with sera from 6 of 12 patients with histoplasmosis and 2 of 12 patients with

AB We have previously reported on the alternate regulation of gamma interferon (IFN-gamma) and interleukin-4 (IL-4) in inbred mouse strains which differ in their susceptibility to **Coccidioides** immitis. The genetically resistant DBA/2 mice manifest a predominant T-helper 1 (Th1) response, with early production of IFN-gamma, whereas susceptible BALB/c mice show an early production

of the Th2 cytokine IL-4. Since IL-12 is one cytokine that can act early during host defenses to promote the differentiation of cytokine production towards IFN-gamma and thus may promote expression of a protective immune response, we investigated the role of IL-12 in resistance to C. immitis. Administration of recombinant IL-12 to the susceptible mouse strain before and after systemic (intraperitoneal) challenge with C . immitis significantly ameliorated the course of the disease, as measured by a reduction in the fungal load in the lungs, liver, and spleen. Analysis of the cytokine mRNA in lungs from infected BALB/c mice revealed that the protective effect of recombinant IL-12 was accompanied by a shift from a Th2 to a Th1 response. The importance of IL-12 in resistance to this fungus was further established by showing that neutralization of endogenous IL-12 in the resistant DBA/2 mouse strain led to a significant increase in the fungal burden in pulmonary and extrapulmonary tissues. These results establish that IL-12 plays a pivotal role in the host defense against systemic challenge with C. immitis.

Previous expts. have provided evidence that Coccidioides immitis antigen 2 (Ag2) is a major T-cell-reactive component of mycelia and spherule cell walls. Here the authors report the identification and cloning of the cDNA that encodes Ag2 from a lambda ZAP cDNA expression library constructed from spherule-derived RNA. DNA sequence anal. established that the 1,255-bp clone contains a 174-bp 5' untranslated region, a 582-bp open reading frame which encodes for a protein consisting of 194 amino acids, and a 375-bp 3' untranslated region, including a poly(A) tail. The recombinant Aq2 protein has a predicted mol. mass of 19.5 kDa and contains an 18-amino-acid N terminus which has been tentatively identified as a signal peptide. The Ag2 cDNA was ligated into the pGEX-4T-3 vector and expressed in Escherichia coli TG-1 cells as a glutathione S-transferase fusion protein. The recombinant fusion protein showed reactivity with sera from patients with coccidioidomycosis and elicited delayed-type footpad hypersensitivity responses in Coccidioides-immune mice. These results suggest that the Ag2 cDNA can be used for the large-scale production of this immunol. important protein.

AB Detection of anti-Coccidioides complement-fixing (CF) antibody is a valuable diagnostic and prognostic aid in coccidioidomycosis. The CF antibody response is directed

against a heat-labile antigen that has chitinase activity, hereafter referred to as the CF/chitinase protein. To identify and

referred to as the CF/chitinase **protein**. To identify and clone this immunoreactive enzyme, the authors constructed a **Coccidioides** immitis cDNA lambda ZAP expression library from

spherule RNA and detected fusion peptides expressing CF

epitopes by immunoscreening. A cDNA clone consisting of 1623 bp was identified, sequenced, and found to contain a single open reading

frame that encodes a protein of 47 kDa with 427 amino

acids. Deduced amino acid sequence analyses showed that the cloned CF/chitinase cDNA contains a 35-amino-acid region, beginning at Ser-18 and ending at Arg-52, which has 92% homol. with the reported

N-terminal amino acid sequence of authentic CF/chitinase protein. The first 17 amino acids in the deduced sequence of the cloned cDNA are not present on the mature CF/chitinase

protein, suggesting that it may be a signal peptide
. Expression of the CF/chitinase cDNA insert by using the pGEX-4T-3
vector yields a fusion peptide that bears CF-specific

epitopes and shows chitinase activity. The CF/chitinase clone will enable large-scale production of the recombinant CF antigen for use in immunoassays and facilitate studies on the role of chitinase in the morphogenesis of C immitis.

AB Antigen 2 is a glycosylated **protein** present in the cell walls of the dimorphic fungus **Coccidioides** immitis. Using

oligodeoxyribonucleotide (oligo) primers based on the sequences of Ag2 cDNA, the gene encoding Ag2 was cloned from genomic DNA derived from the mycelial phase of C. immitis by PCR.

Nucleotide (nt) sequence analyses showed a 582 base pair (bp) ORF

disrupted by two introns which are 78bp and 10lbp long. The deduced primary translation product consists of 194 amino acids (aa), contains an N-terminal putative signal sequence to allow transport into the endoplasmic reticulum, and a C-terminal putative signal sequence to enable a GPI anchor addition Putative GPI anchor/cleavage site and O-glycosylation sites, as well as phosphorylation and myristoylation sites are also present. On the basis of these analyses, the authors predict that a prepro-Ag2 undergoes a post-translational modification to yield the mature glycosylated Ag2 protein which is anchored on the extracellular plasma membrane of mycelial and spherule-phase cells.

The profiles of γ interferon (IFN- γ) and interleukin-4 AΒ (IL-4) production were valuated during the course of coccidioidomycosis in 2 inbred mouse strains which differ in their susceptibility to C. immitis. Cytokine responses, measured at the mol. and protein levels, showed increased levels of IFN- γ in lung exts. from mice of the resistant DBA/2 strain after a pulmonary challenge, whereas the susceptible BALB/c strain manifested a predominant IL-4 response. The importance of these cytokines in host defense against ${\bf C}$. immitis was established by treating the mice with recombinant cytokines or neutralizing anticytokine monoclonal antibodies. Treatment of the susceptible BALB/c mice with recombinant murine IFN- γ protected mice against systemic challenge, and in the reciprocal experiment, the administration of an anti-IFN- γ monoclonal antibody to the resistant DBA/2 mice decreased their capacity to control disease. Although the treatment of DBA/2 mice with recombinant IL-4 did not alter the disease, neutralization of endogenous IL-4 in infected BALB/c mice by administration of a neutralizing anti-IL-4 antibody led to a reduction in the fungal load in their tissues. Apparently, IFN-γ plays a pivotal role in resistance to C. immitis,

L76 ANSWER 17 OF 25 HCAPLUS COPYRIGHT 2003 ACS on STN DUPLICATE 14

whereas IL-4 down-regulates protective immunity against C.

Antigen 2 (Ag2) has been implicated as a T-cell-reactive component

of the pathogenic fungus C. immitis. This report describes the production of a murine monoclonal antibody (MAb) of

the IgG2a isotype that recognizes an epitope specific to C

.immitis Ag2. This specificity was evidenced by the

finding that the MAb did not recognize other antigens present in coccidioidin or spherulin and did not show reactivity with antigenic exts. from Histoplasma capsulatum or Blastomyces dermatitidis. The epitope was labile to enzymic digestion with

pronase but resistant to treatment with glycolytic enzymes and to periodate oxidation This peptide epitope appears to require conformational structure because it was not recognized by the MAb in

immunoblots of antigen that had been electrophoresed in polyacrylamide gels under denaturing, reducing conditions.

Immunoaffinity chromatog. of spherulin on columns containing the MAb established that the MAb was effective as a ligand for isolating Ag2 from heterogeneous exts. The production of a MAb which recognizes an Ag2-specific epitope and its utility as a ligand for isolating Ag2 will provide a valuable reagent for studies of this immunol.

important antigen.

LANGUAGE: English SUMMARY LANGUAGE: English

The cellular localization of the tube precipitin (TP) and complement fixation (CF) antigens of Coccidioides immitis was

examined by immunoelectron microscopy with murine immunoglobulin G1 monoclonal antibodies directed against the TP and CF antigens, respectively. Immunoelectron microscopic analyses of saprobic- and parasitic-phase cells showed that the TP antigen is present at a high concentration within the inner cell wall layer and along the

plasma membrane. The antigen was also detected, at a lesser concentration, within cytoplasmic vacuoles. In contrast to the

predominant localization of the TP antigen in the cell walls, the CF antigen resides primarily within the cytoplasm, where it appears to be dispersed throughout the cytoplasm rather than associated with a specific cytoplasmic organelle. A sparse amount of the CF antigen within the inner cell walls was also demonstrable. The localization of the TP and CF antigens throughout the morphogenetic phases of C. immitis has important implications in antigen production and in analyses of host response in coccidioidomycosis.

Deglycosylation of glycoproteins in a lysate of spherules of C. immitis has permitted purification and partial characterization of a proline-rich pronase-sensitive antigen. Moreover, soluble antigen specifically stimulated lymphocytes from persons with dermal delayed-type hypersensitivity to coccidioidal antigens. When related to reference coccidioidin by tandem 2-dimensional immunoelectrophoresis, the antigen fused in the anodal region with a specific reference antigen (antigen 2). It did not show identity with coccidioidal antigens used in conventional serol. assays. Although immunoblots of the purified protein with monospecific rabbit antiserum showed a single antigen at 33 kDa, the parent spherule lysate bound the same antibody in a broad band between 70 and >200 kDa, which could be explained by microheterogeneity of glycosylation. Immunoelectron microscopy using affinity-purified human antibodies localized the antigen to the cell wall and internal septa of

> 308-4994 Searcher : Shears

complement-fixing antibody (IDCF) is widely viewed as the most useful immunodiagnostic test for coccidioidomycosis. Here is reported the production of an IgG1 monoclonal antibody (MAb) to the IDCF antigen for use as a biospecific ligand for purifying the IDCF antigen on solid-phase immunosorbents and for use as a reagent for screening genomic or cDNA expression libraries from C. immitis. BALB/c mice were immunized by i.m. injections of coccidioidin in adjuvant, followed by an intrasplenic booster injection of coccidioidin in saline. The spleen cells were fused with SP2/O Ag14 myeloma cells, and the fusion products were screened for IgG antibody to coccidioidin by using an ELISA. Pos. hybridomas were cloned and evaluated for reactivity to the IDCF antigen by 2-dimensional immunoelectrophoresis and by immunoblotting. The epitope recognized by the MAb was heat labile (60°, 30 min) and susceptible to enzymic digestion with pronase but was resistant to treatment with lipase, α -mannosidase, glucose oxidase, and endoglycosidase H. This heat-labile peptide epitope appears to be specific to C. immitis, as judged by the fact that the MAb was not reactive in immunoblots or ELISAs of histoplasmin or blastomycin.

DOCUMENT TYPE: Journal LANGUAGE: English

The cytokine tumor necrosis factor α (TNF- α) functions as an immunomodulatory protein and as a mediator of cachexia. Here, the viable or formalin-killed spherules of C. immitis induced the secretion of TNF- α by peritoneal-exudate cells from BALB/c mice. The identification of the cytokine as TNF- α was based on its lytic activity against the $\bar{T}NF-\alpha$ -sensitive Ls murine fibrosarcoma cell line but not the TNF- α -resistant LR cell line, its neutralization by rabbit anti-TNF- α , and its secretion by peritoneal cells having characteristics of macrophages. The induction of TNF- α was attributable to spherules and not to contaminating lipopolysaccharide (endotoxin), as evidenced by the finding that polymyxin B, a reagent that blocks the TNF- α -inducing component of lipopolysaccharide, did not negate the production of $TNF-\alpha$ in response to spherules, whereas pretreatment of spherules with hyperimmune goat antiserum to spherulin neutralized the induction of TNF- α by these cells. The demonstration that C. immitis activates macrophages to secrete $TNF-\alpha$ in vitro is a new finding and warrants studies to determine whether this cytokine is produced during active coccidioidomycosis.

Comparisons of the course of coccidioidomycosis in two AB strains of inbred mice established that BALB/c mice are significantly more susceptible to pulmonary infection with

Coccidioides immitis than are DBA/2 mice. The

susceptibility of BALB/c mice does not reside in their inability to

mount a delayed-type hypersensitivity response to C. immitis antigen. That is, BALB/c mice manifested footpad hypersensitivity to coccidioidin early during the course

of disease, to a level comparable to that of DBA/2 mice. In contrast to the more resistant DBA/2 mouse strain, however, BALB/c

mice developed anergy by day 15 postinfection. Suppression of the

delayed-type hypersensitivity response was not specific for

C. immitis antigen, as evidenced by the finding

that BALB/c mice immunized with mycobacterial purified

protein derivative prior to infection with C.

immitis were suppressed in their footpad response to mycobacterial antigen at day 15 postinfection. Taken together, these results establish that genetically determined susceptibility

to this fungus is associated with an acquired suppression of cell-mediated immune reactivity.

Lymphocyte transformation (LT) responses to coccidioidin (CDN) and spherulin were suppressed in 11 (73%) of 15 patients with active coccidioidomycosis when their mononuclear cells were assayed in autologous serum as compared to serum from healthy, CDN skin test-positive subjects. Suppressed LT responses were specific for Coccidioides immitis antigens in 7 (64%) of the 11 patients. Immunoaffinity chromatography of patient sera with Staphylococcus protein A adsorbed the suppressor component(s) and thereby established that suppression was attributed to immunoglobulin G, either alone or complexed with antigen. The possibility that suppression was mediated by immune complexes was examined by adding complexes formed in vivo or in vitro to mononuclear cell cultures of healthy CDN-reactive persons before LT assays. Although complexes prepared in this manner were reactive in an enzyme-linked immunosorbent assay designed to detect Coccidioides antigen-specific immune complexes, no suppression of LT responses was observed. We conclude that serum-mediated suppression of LT responses in coccidioidomycosis is attributed to monomeric and not immune-complexed immunoglobulin G antibody.

                                                                                                                                                 Sequences AASS9806-AASS9804 represent DNA molecules encoding associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions cueed by P. acnes. The proteins and their diagnosis of medical conditions cueed by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomytelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies and therefore treat P. acnes proteins. These antibodies and therefore treat P. acnes indections. The antibodies may also be used as diagnostic agents for determining P. acnes presence encodes the polypeptides shown in AAUGS636-AAUGS64 and AAUG7799-AAUG7800.

Supplient bacterium acres journel properties. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acres. The disorders include (SAPHO syndrome (Synovitis, acne, pustulosis, hypertosis and solders include (SAPHO syndrome (Synovitis, acne, pustulosis, hypertosis also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypetides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be cased to downregulate expression and activity of P. acnes polypeptides and ctivity of P. acnes polypeptides and ctivity of P. acnes presence, for example, by cased to downregulate expression and activity of P. acnes polypeptides and ctivity of P. acnes presence encodes the diagnostic agents for determining P. acnes presence, for example, by company of inked immunosorbent assay (ELISA). This sequence encodes the polypeptides shown in AAMUSSSS-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSSO-AAMUSSO-AAMUSSO-AAMUSSSO-AAMUSSSO-AAMUSSO-AAMUSSO-AAMUSSO-AAMUSSO-AAMUSSO-AAMUSSO-AAMUSSO-AAMUSSO-AAMUSSO-AAMUSSO-AAMUSSO-AAMUSSO-AAMUSSO-AAMUSSO-AAMUSSO-AAMUSSO-AAMUSSO-AAMUSSO-AAMUSSO-AAMUSSO-AAMUSSO-AAMUSSO-AAMUSSO-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Conserved Effector Loci; CEL; cytostatic; antibacterial; gene therapy; Exchangeable Effector Loci; EEL; disease resistance; transgenic plant; eukaryotic cell death; cancer; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The inversion fractive to an isolated multiple and acts mousefule comprising a nucleotide sequence encoding proteins or polypeptides of Pseudomonas Conserved Effector Loci (CEL) and EEL DNA are useful for imparting disease resistance to a plant, by transforming a plant cell with the nucleic acid and regenerating a transgenic plant from the transformed plant cell, where the transgenic plant expresses a heterologous DNA molecule under conditions effective to impart disease resistance, or by treating a plant with an isolated protein or polypeptide, by applying the protein or polypeptide, under conditions effective to impart of plant cell in an isolated form or by applying a non-pathogenic bacteria which ascretes the protein or polypeptide, under conditions effective to impart disease resistance to the treated plant. CEL and EEL proteins are useful for causing eukaryotic cell death, by introducing a cytotoxic sequence cells of a patient under conditions effective to cause cell death. CEL and EEL proteins are also useful for treating a cancer cells of a patient under conditions effective to cause death of cancer cells of a patient under condition. The method thrust reating the expected DNA delivery system comprising a DNA molecule encoding the cytotoxic Pseudomonas protein, to the patient, where the targetted DNA delivery system delivers the condition and the cytotoxic Pseudomonas protein, conditions effective to sequence the cancer cells and the cytotoxic Pseudomonas protein, conditions effective to sequence the cancer cells and encoding the cytotoxic Pseudomonas protein, conditions effective to sequence the cancer cells and encoding the cytotoxic Pseudomonas protein, conditions effective to the patient, where the targetted DNA delivery system delivers the cancer cells and encoding the cytotoxic Pseudomonas protein, and approxed and an encoding the cytotoxic Pseudomonas protein, and approxed and an encoding the system delivers the present sequence is a DNA and an encoding the cytotoxic pseudomonas protein and appro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                         invention relates to an isolated nucleic acid molecule comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pseudomonas aeruginosa DNA for cellular proliferation protein #452.
                                                                                                                                                                                                                      New nucleic acid molecules encoding proteins or polypeptides of
Pseudomonas Conserved Effector Loci and Exchangeable Effector Loci
genomic sequences, for imparting disease resistance to plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       is expressed in the cancer cells. The present sequence is a DN encoding Pseudomonas syringae pv. syringae (Psy) shcA protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ..

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential conservations their sets of genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella consemble sets descouled are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella consential montantia, Pseudomonas aeruginosa and Enterococcus faccalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery control of the proteins can be used to screen compounds in rational drug discovery control of production callular proliferation in a wide variety of organisms. The protein callular proliferation protein. Note: The sequence data for this patent did not form part conficuration in the printing specification, but was obtained in electronic conficuration in electronic directly from wito at the printing and the properties of the printing and the properties of the printing and the properties of the printing and the printing and the properties of the printing and th

The invention relates to sixty six novel isolated Drosophila melanogaster G-protein coupled receptors (GPCR). The GPCR proteins and nucleic acids are useful in the treatment and diagnosis of GPCR-related conditions. The GPCR proteins and nucleic acids are also useful for identifying modulators of GPCR proteins for use as insecticides. The nucleic acid can also be used to detect mutations in GPCR genes and gene expression products such as mRNA. AAS57072-AAS57203 represent D melanogaster G-coupled protein receptor genomic and coding sequences of
                                                                                                                                                                     The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                              The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Drosophila, G-protein coupled receptor, GCPR, insecticide, diagnostic, mutation detection; ss.

                                                                                                                                                                                                                                                                        capable of detecting 1000 or more genes from brosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL/6176-ABL/30511), expressed DNA sequences (ABL/6175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                     New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid detection reagent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Drosophila melanogaster expressed polynucleotide SEQ ID NO 17456.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel polypeptides (P1) from Drosophila melanogaster having the biological activity of a peptide receptor. Molecules of the invention are used to find new plant protection compounds or insecticides, or to find genes encoding a polypeptide involved in the structure of functionally similar receptors in insects This sequence encodes a Drosophila melanogaster (fruitfly) peptide receptor described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                      New polypeptides from Drosophila melanogaster have biological activity of peptide receptor, useful to find new compounds for plant protection and insecticides
                                                                                                                                                                                                Insect; fruitfly; peptide receptor; plant protection; insecticide; ss.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Drosophila, G-protein coupled receptor, GCPR, insecticide, diagnostic,

                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is
                                                                                                                                          The invention relates to sixty six novel isolated Drosophila melanogaster G-protein coupled receptors (GPCR). The GPCR proteins and nucleic acids are useful in the treatment and diagnosis of GPCR-related conditions. The GPCR proteins and nucleic acids are also useful for identifying modulators of GPCR proteins for use as insecticides. The nucleic acid can also be used to detect mutations in GPCR genes and gene expression products such as mRNA, A855702-A8557203 represent D. melanogaster G-coupled protein receptor genomic and coding sequences of

The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (EST). The ESTs are used in the methods for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. Monitoring the global expression of genes from FF cells allows the production the global expression of unknown open reading frames can be identified and gene copy number variation and stability can be monitored. The expression of genes can be used to study how FF cells
                                                                                                                                                                                                      The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        uses fluorescence-labeled nucleic acids isolated from the cells and a substrate of expressed sequence tags -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Multiple gene expression; filamentous fungal cell; EST; expressed sequence tag; Fusarium venenatum; Aspergillus niger; Aspergillus oryzae; Trichoderma reesei; identification; recombination; culture condition; environmental stress; spore morphogenesis; metabolic pathway engineering; catabolic pathway engineering; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PB;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Olsen

adapt to changes in culture conditions, environmental stress, spore morphogenesis, recombination, metabolic or catabolic pathway engineering. Using ESTs provides several advantages over genomic or random cDNA clones including elimination of redundancy as one spot on a array equals one gene or open reading frame, and organisation of the microarrays based on function of the gene products to facilitate analysis of the results. AAF01748 to AAF11247 represents ESTs from figer; AAF11248 to AAF11853 represents ESTs from Aspergillus niger; AAF1184878 represents ESTs from Aspergillus oryzae; and AAF14979 to AAF118478 represents ESTs from Aspergillus oryzae; all specifically claimed in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymersae chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantiteting a polypeptide in issue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders involving described to the sexpression or biological activity.
                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       88
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, chromosome mapping; gene mapping; gene therapy, forensic, food supplement; medical imaging; diagnostic; genetic disorder;

The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other trains to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention.

Note: The sequence data for this patent appear in the printed specification, but was obtained in electronic format directly from WIPO

(HUMA-) HUMAN GENOME SCI INC

WPI; 2001-483426/52.

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -

Disclosure; SEQ ID NO 25674; 3071pp + Sequence Listing; English.

AAX54951 to AAX64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
expression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
consultational activity of (I) by expressing inactive proteins or to
cypy and the patients own production of (I). Additionally, (I)
confortational activity of the nucleic acids into a host cell and culturing the cell to express the
cypy and treat immune/haematopoietic-related diseases, especially
cancers and cancer metastases of haematopoietic antigen genomic
conforts and cancer metastases of haematopoietic antigen genomic
sequences from the present invention. AAX54942 to AAX64950 and AAM82169
cypy represent invention. AAX54942 to AAX64950 and AAM82169

The invention relates to detecting (MI) granulocyte (GC) activation (GCA), by detecting the level of expression of gene(s) (Gs) identified by DNA detecting the level of expression of Ges identified by CDNA chip analysis as given in the specification, and comparing the expression level in an unactivated of the expression level in an unactivated CGC, where differential expression of Gs is indicative of GCA. Also included are modulating (M2) GA by contacting GC with an agent that alters the expression of at least one gene in Gs; (2) screening (M3) cronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatcry disease using the chornic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatcry disease, by detecting the chornic) in a tissue, an allergic response in a subject to a pathogen or sterile inflammatcry disease, by detecting the level of expression in a sample of the tissue of gene(s) from Gs, where CC level of expression in a sample of the tissue of inflammation, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory desease, by contacting a tissue having inflammation with an agent that modulates the expression of gene(s) from Gs in the tissue. M1 is useful for detecting an inflammation (especially chronic) or in a tissue, an allergic computating GA; M3 is useful for screening an agent capable of modulating GA; M3 is useful for screening an agent capable of modulating GA; M3 is useful for screening an agent capable of computating GA; M3 is useful for screening an agent capable of computating GA; M3 is useful for screening an agent capable of modulating GA; M3 is useful for screening an agent capable of modulating GA; M3 is useful for screening an agent capable of modulating GA; M3 is useful for detecting an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory bowel disease; also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        granulocyte activation by detecting differential expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; 88; granulocytic cell; DNA chip; bacterial infection, viral infection; parasitic infection; protozoal infection; fungal infection; sterile inflammatory disease; psoriasis; rheumatoid arthritis; alomerulonephritis; asthma; thrombosis; cardiac reperfusion injury; renal reperfusion injury; ARDS; andlt respiratory distress syndrome; inflammatory bowel disease; crohn's disease; ulcerative colitis; periodontal disease; granulocyte activation; chronic inflammation; allergy.
                                                                                                                                                                                                                                                                                                                                                       Human cDNA differentially expressed in granulocytic cells #135.

The present invention relates to corn auxin transport protein coding sequences and proteins. The present sequence is one such coding sequence. This sequence may be used to modulate root development, e.g. to produce a more robust root system, alter root angle or redirect root growth. Also, the present sequence may be useful for gene mapping (e.g. for plant breeding) and to identify loss of function mutants. The protein encoded by the present sequence may be useful for raising specific antibodies, for the detection of auxin transport proteins and to design and/or identify specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    inhibitors of auxin transport proteins, potentially useful as herbicides.
                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                            sequence represents a gene differentially expressed in granulocytes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  25296 recadificetreacaretreacarieretrecerreceaaagerecagi 25247

                       AAF71300;
The present invention provides a number of nucleotide and protein are dequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analyzing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing mainto acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel polynucleotides derived from Coryneform bacteria, for identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene

AAF71138 to AAF71357 encode the Corynebacterium glutamicum homeostasis and adaptation (HA) proteins given in AAB7923 to AAB79242. The C. glutamicum HA genes (I) can be used in vectors for expression in host cells and production of fine chemicals, such as, an organic acid, proteinogenic or nonproteinogenic amino acid (preferred), purine or proteinogenic or nonproteinogenic amino acid (preferred), purine or proteinogenic or nonproteinogenic amino acid (preferred) purine or fatty acid, diol, carbohydrate, aromatic compound, vitamin, cofactor, polyketide or enzyme. The amino acids produced can be lysine, glutamine, glutamate, alanine, aspartate, glycine, serine, threonine, methionine,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated Corynebacterium glutamicum nucleic acid for production or modulation of production of fine chemicals such as amino acids, nucleosides, nucleotides, lipids, fatty acids, carbohydrates, vitamins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Zelder O, Haberhauer G;

ö
                            can
cysteine, valine, leucine, isoleucine, arginine, proline, histidine, tyrosine, phenylalanine, or tryptophan. The fine chemical production can be modulated. The presence of (I) or HA proteins encoded by then are used for diagnosing the presence or activity of Corynebacterium diphtheriae. (I) can be used to map the C. glutamicum genome or used as markers for genetically engineered Corynebacterium or used as markers for genetically engineered Corynebacterium or homeostasis in C. glutamicum or help the microorganism to adapt to different environmental conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention provides two major E. maxima gametocyte antigens having molecular weights of 56 and 82 kDa and encoding polynucleotides. The gametocyte antigens can be produced by standard recombinant methodology. The encoding polynucleotides are useful for preparing a vaccine against Eimera tenella, E. acervulina, E. necatrix, E. praecox, E. maxima, E. mitis or E. brunetti infection. The present sequence represents a E. maxima 230 kDa gametocyte antigen cDNA clone.
                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid comprising a sequence encoding a 56 kDa or 82 kDa
polypeptide from gametocytes of Eimera maxima, useful for preparing
vaccine against Eimera infection

The present invention describes a nucleic acid (1) comprising a sequence encoding a 250 kba polypeptide from Sporozoites/Merozoites of sequence encoding a 250 kba polypeptide from Sporozoites/Merozoites of Sequence comprising the nucleic acid; (2) a host cell comprising the nucleic acid; (2) a host cell comprising the nucleic acid; (3) a present comprising the nucleic acid; (4) a transformed collocopy (6) a recombinant polypeptide; (4) a transformed collocopy (6) a recombinant polypeptide; (7) a vaccine against collocopy (6) a recombinant polypeptide; (7) a vaccine against collocopy (8) a microorganism expressing an immunologically cross-reactive antigen; (8) immunising a subject against infection by Elmeria, or a microorganism expressing an immunologically cross-reactive conservation upon a newborn subject of an avian species antigen; (9) conferring upon a newborn subject of an avian species of maternal immunity against infection by Elmeria; (10) a fertilised egg cfrom an avian species having an air sac, where the air sac is incoulated with the vaccine; and (11) reducing the output of Eimeria oocytes in faces from a newborn subject of an avian species (1) has antiparasitic collisions and each ne used in a vaccine and in gene therapy. The nucleic collisions acid is useful for preparing a vaccine against E. tenella, E. gracerox, E. maxima, E. mitts or E. brunetti infection.

The present sequence represents a 250 kba antigen protein homologous DNA xx
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid comprising a sequence encoding a 250 kDa polypeptide from sporozoites/merozoites of Elmeria maxima, useful for preparing a

The present invention describes a nucleic acid (I) comprising a sequence encoding a 250 kDa polypeptide from Sporozoites/Merozoites of Eimeria maxima or its homologue or complement. Also described: (I) a vector comprising the nucleic acid; (2) a host cell comprising the nucleic acid; (2) a host cell comprising the nucleic acid; (3) producing a recombinant 250 kDa polypeptide; (6) a recombinant 201ypeptide; (7) a vaccine against E. tenella, E. acervulina, E. necatrix, E. praecox, E. maxima, E. mitis or E. brunetti or a microorganism expressing an immunologically cross-reactive antigen; (9) immunising a subject against infection by Eimeria, or a microorganism expressing an immunologically cross-reactive antigen; (9) conferring upon a newborn subject of an avian species maternal immunity against infection by Eimeria; (10) a fertilised egg from an avian species having an air sac, where the air sac is incoulated with the vaccine; and (11) reducing the output of Eimeria ocytes in activity and can be used in avaccine and in gene therapy. The nucleic activity and can be used in a vaccine and in gene therapy. The nucleic cativity and can be used in a vaccine against E. tenella, E. acervulina, E. necatrix, E. preparing a vaccine against E. tenella, E. acervulina, E. ecatrix, E. preparing a vaccine against E. tenella, E. acervulina, The present sequence encodes a 250 kDa antigen protein, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                 / restial

The present invention describes a nucleic acid (I) comprising a sequence encoding a 250 kDa polypeptide from Sporozoites/Merozoites of Eimeria maxima or its homologue or complement. Also described: (I) a vector comprising the nucleic acid; (2) a host cell comprising the nucleic acid; (2) a host cell comprising the nucleic acid; (3) a producing a recombinant 250 kDa polypeptide; (6) a recombinant polypeptide; (7) a vaccine against E. tenella, E. acervulina, E. nectrix, E. praecox, E. maxima, E. mitis polypeptide; (6) a recombinant polypeptide; (7) a vaccine against E. E. brunetti or a microoganism expressing an immunologically cross-reactive antigen; (9) conferring upon a newborn subject against infection by Eimeria, or a microorganism expressing an immunologically cross-reactive antigen; (9) conferring upon a newborn subject of an avian species material immunity against infection by Eimeria, (10) a fertilised egg from an avian species having an air sac, where the air sac is inoculated with the vaccine; and (11) reducing the output of Eimeria oocytes in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid comprising a sequence encoding a 250 kDa polypeptide from sporozoites/merozoites of Eimeria maxima, useful for preparing a vaccine against Eimeria infection

faeces from a newborn subject of an avian species. (I) has antiparasitic activity and can be used in a vaccine and in gene therapy. The nucleic acid is useful for preparing a vaccine against E. tenella, E. acervulina, E. necatrix, E. praecox, E. maxima, E. mitis or E. brunetti infection.

The present sequence encodes an E. maxima immunodominant protein, which

The present sequence contains a cluster of genes that encode polyketide synthases (PKSs) that are involved in the synthesis of soraphens in Soranglum cellulosum. The proteins encoded by the present sequence are Soranglum cellulosum. The proteins encoded by the present sequence are SorR, SorA, SorB and SorM. SorA and SorB contain biosynthetic modules which contain a beta-ketoacylysuchase, an acyltransferase, a ketoreductase and an acyl carrier protein domain, as well as beta-ketone processing domains. S. cellulosum soraphens are useful as a cytostatic and antimicrobial agent active against phytopathogenic fungi. Soraphen-producing transgenic plants or biological control agents can also be produced, which may reduce crop losses and nutritional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present sequence represents the BLM (Bleomycin) gene cluster, containing open reading frames (ORFs) 8-10. The proteins encoded by the gene cluster are useful for producing peptides and/or poolyketide metabolites, especially bleomycin or bleomycin analogues. They are also useful for chemically modifying biological molecules to produce branched methyl groups, and for coupling amino acids and fatty acids. They may be reacted with an approgramic protein and coenzyme A to produce a holo-carrier protein. The BLM gene cluster or catalytic thiazolidine, thiazolime, bithiazolime and bithiazolime, containing microbial metabolites. The BLM gene cluster may also be used to produce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, Coryneform bacterium, coryneform bacterium, packers and organic acids, on ucleic acids, ucleanins, saccharides and organic acids, in the examplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the

The invention relates to an isolated polynuclectide (I) comprising a nucleotide sequence selected from any of 948 sequences

(Mazilli9-Mazil066) or their mature protein coding portion, active domain coding protein or complementary sequences. The polynucleotides are useful for identifying expressed genes or for physical mapping of human genome. The encoded polypeptides (ABB68902-ABP68849) are useful as molecular weight markers as a food supplement, for generating and incorporation or Alzheimers and food supplement, for generating and incorporation of seases (call-proliferative disorders (cancer), neurodegenerative diseases

(Parkinson's or Alzheimer's disease), autoimmune diseases (multiple soll-proliferative disease), autoimmune diseases (multiple soll-proliferative disease), interfaction disorders, wound, burns, incision, closers, liver or lung fibrosis, infections (bacterial, viral, fungal, parasitic), arthritis, etc.

Note: The sequence data for this patent did not form part of the printed per specification, but was obtained in electronic format directly from MIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Leinamycin biosynthesis gene cluster; Lmn; open reading frame; ORF; anti-tumour antibiotic; broad spectrum antimicrobial activity; Gram-positive; Gram-negative bacteria; chemical modification; metabolite; apo-carrier protein; holo-carrier protein; tumour; polyketide; hybrid polypeptide/polyketide metabolite; Lnm production;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 23.6; DB 24; Length 1415;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to the isolation of the Streptomyces atroolivaceus leinamycin (Lnm) biosynthesis gene cluster containing 11 per reading frames (ORFs -15 through -1, ORFs InmA through InmA. and ORFs +1 through +9). Celnamycin is a novel anti-tumour antibiotic produced by several Streptomyces species. It exhibits broad spectrum antimicrobial activity against Gram-positive and Gram-negative bacteria, but not against fungl The polypeptides encoded by the Lnm biosynthesis gene cluster ORFs are useful for chemically modifying a molecule in a host cell. The host cell is a bacterium or evaspencial is a mendogenous metabolite produced by the host cell. The molecule is an endogenous metabolite produced by the host cell or exogenously supplied metabolite, or an amino acid, and the polypeptides is a peptide synthetase or amino transferase. The polypeptides and/or the Lnm gene cluster are useful for converting an apo-carrier protein to a holo-carrier protein. Lnm shows potent and/or polyketide, and/or hybrid polypeptide/polyketide metabolites. The fungene cluster is useful to myergulate endogenous Lnm shows and/or polyketide, and/or hybrid polypeptide/polyketide metabolites. The Lnm gene cluster is useful to upregulate endogenous Lnm production to permit Lnm production in cells and/or to make various modified Lnm. Compination its analogue, or other polyketide, peptide or hybrid polyketide metabolites concleve permit Lnm production in cells and/or to make various modified Lnm. The Lnm spenent sequence represents the S. atroolivaceus leinamycin higher cluster.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                               The invention relates to cytomegalovirus (CMV) intron A fragments for use in expression construct for expressing gene products. Recombinant expression construct is useful for producting a recombinant polypeptide. Human cytomegalovirus (bCMV) intron A fragment is useful in expression constructs to express a wide variety of substances including peptides. It is also useful for treating a variety of malignant cancers, and for producing proteins useful for prevention, treatment and/or diagnosis of a wide variety of diseases. Recombinant expression construct is used in nucleic acid immunisation and gene therapy. The present sequence is pCOM3 deletion mutant construct intron A fragment used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ·.

```
Auxins are plant hormones that influence plant behaviour and development e.g. vascular tissue differentiation, apical development, tropic responses and organ (e.g. flower, laef) development. The present invention relates to corn auxin transport protein coding sequences and proteins. The present sequence is one such coding sequence. This sequence may be used to medulate root development, e.g. to produce a more robust sequence may be useful for gene mapping (e.g. for plant breeding) and to identify loss of function mutants. The protein encoded by the present sequence may be useful for raising specific antibodies, for the detection of auxin transport proteins and to design and/or identify specific inhibitors of auxin transport proteins, potentially useful as herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mitomycin; biosynthesis; mitosane ring system; antibiotic; anti-cancer; anti-inflammatory; immune-enhancer; immunosuppressant; asthma; chronic obstructive pulmonary disease; respiratory inflammation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes substantially purified human proteins

(referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1
in the specification). ABN15762 to ABN27252 encode the human ORFX

proteins given in ABP00101 to ABP11500. ORFX proteins are useful for

treating or preventing a pathology associated with an ORFX-associated

disorder in humans, and in the manufacture of a medicament for treating a
syndrome associated with ORFX-associated disorder. ORFX polynucleotide

csquences can be used in gene therapy. ORFX sequences can be used in the

treatment of cancer, hyperproliferative disorders, cirrhosis of liver,

psoriasis, benign tumours, keloid, degenerative disorders related to organ

transplantation, cardiovascular diseases, diabetes mellitus, systemic

cransplantation, cardiovascular diseases, diabetes mellitus, systemic

cransplantation, ardiovascular diseases, diabetes mellitus, systemic

craring disease, autoimmune thyroiditis, myasthenia gravis, graft-versus-host

disease and autoimmune inflammatory eye disease. ORFX proteins are also

cuseful for treating burns, incisions, ulcers, for treating osteoporosis,

bone degenerative disorders, or periodontal disease, and for gut

cransfined in tegeneration and treatment of lung or liver fined for men and conditions resulting for the conditions results and conditions resulting for the conditions resulting for the conditions results or condit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence data for this patent did not form part of the printed fication, but was obtained in electronic format directly from WIPO

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Drosophila melanogaster expressed polynucleotide SEQ ID NO 19811.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to isolated and purified nucleic acid molecules from the mitomycin biosynthetic gene cluster. Mitomycins are a group of natural products that contain a variety of functional groups, including amino benzoquinone and axitidine ring systems. The S. lavendulae mitomycin biosynthetic gene cluster comprises 47 mitomycin genes spanning 5skb of DNA. The invention includes an expression cassette comprising a mitomycin biosynthetic gene operably linked to a promoter, and host cells transformed with the cassette. The nucleotide, and protein sequences and the transformed host cells of the invention result in antiasthmatic, antiinflammatory, cytostatic, immunomodulatory, and nucleotide sequences are used to elucidate the molecular basis for the biosynthesis of the mitosane ring system, as well as to engineer the biosynthesis of novel natural products, e.g. antibiotics, anti-inflammatory agents, anti-cancer agents, crea gents, cobstructive pulmonary disease as well as other disease involving respiratory inflammation, or cholesterol-lowering agents or s crop protection agents (e.g., fungicides or insecticides) as well as Experiment or Subjoymers e.g., in packaging or biomedical applications, or to engineer PHA monomer synthases. Sequences AACSS912-CSS814, AACSS812-CSS849 and AACSS828 and and encoded proteins. Sequences AACSS812-CSS814, and the additional policy or the additional policy and the additional policy or species and encoded proteins. Sequences AACSS812-CSS814, and the additional policy or the additional policy or the additional policy or the additional policy or sequences and encoded proteins. Sequences AACSS812-CSS814, and the additional policy or the additional policy or the additional policy or sequences and encoded proteins. Sequences AACSS812-CSS814, and the additional policy or the additional policy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                              Novel nucleic acid molecule comprising mitomycin biosynthetic gene cluster useful for cloning mitomycin biosynthetic genes for elucidating the molecular basis of mitosane ring system biosynthesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Drosophila melanogaster expressed polynucleotide SEQ ID NO 36251.

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                                                                                                                                                             The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL61840-ABL16175) and the encoded proteins
                                  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              is
                                                                                                                          it did not form part of the printed in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             detection reagent for detecting 1000 or more for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences (ABL01840-ABL16175, and the encoded proteins (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL36511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Drosophila melanogaster expressed polynucleotide SEQ ID NO 19808.

This invention relates to isolated and purified nucleic acid molecules
from the mitomycin biosynthetic gene cluster. Mitomycins are a group of
natural produces that contain a variety of functional groups, including
amino benzoquinone and axiridine ring systems. The S. lavendulae
canno benzoquinone and axiridine ring systems. The S. lavendulae
comprising a mitomycin biosynthetic gene cluster comprises 47 mitomycin genes
cc spanning SSkb of DNA. The invention includes an expression cassette
ccomprising a mitomycin biosynthetic gene operably linked to a promoter,
and host cells transformed with the cassette. The nucleotide, and protein
cc antibiotic activities. The nucleotide sequences are used to elucidate the
antibiotic activities. The nucleotide sequences are used to elucidate the
cc molecular basis for the biosynthesis of the mitosane ring system, as well
as to engineer the biosynthesis of novel natural products, e.g.
antibiotics, anti-inflammatory agents, anti-cancer agents,
antibiotics, anti-inflammatory agents anti-cancer agents,
cobstructive pulmonary disease as well as other disease involving
creapiratory inflammation, or cholesterol-lowering agents or as crop
protection agents (e.g., fungicides or insecticides) as well as
bipolymers, e.g., in packaging or biomedical applications, or to engineer
CC blolymers, e.g., in packaging or biomedical applications,
CAACSSBSO-CSSBSG and AACSSBSO-CSSBSG and AACSSBSO-CSSBSG preseent PRA primers used in the
CC cloning of the mitomycin biosynthetic genes.
                                                                                                                                                                                                                                                                                     Mitomycin; biosynthesis; mitosane ring system; antibiotic; anti-cancer; anti-inflammatory; immune-enhancer; immunosuppressant; asthma; chronic obstructive pulmonary disease; respiratory inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel nucleic acid molecule comprising mitomycin biosynthetic gene cluster useful for cloning mitomycin biosynthetic genes for elucidating the molecular basis of mitosane ring system biosynthesis

The invention relates to a composition comprising a human GDP-mannose 4.6-dehydratase (GM4,6D) peptide. The peptide is useful for identifying GM4,6D inhibitors. GM4,6D inhibitors are useful for reducing inflammation in a mammalian subject and for treating or ameliorating diseases affected by the level of cellular fucosylation or diseases affected by the transplant rejection. Asthma, sepsis, reperfusion injury, stroke or infection. The GM4,6D peptide or a polynucleotide encoding it is also useful for manufacturing complex carbohydrates and as targets for infection. The GM4,6D peptide or a polynucleotide encoding it is also useful for manufacturing complex carbohydrates and as targets for creaming small molecule antagonists of the activity of the enzyme. The polynucleotide is useful in developing an assay for defects in the enzyme, as well as in gene replacement therapy. Sequences the saving GM4,6D peptides of the invention.

CM2 MBX17942-MBX17944 and ABX17947-ABX33716 represent DNA molecules encoding human GM4,6D peptides for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Coding sequences (ABP63611-ABP6481 and ABQ98194-ABQ99267). The sequences were discovered in human atherogenic cells, in particular in platelets and human umbilical vein endothelial cells (HUVEC) and are expressed in many other tissues as well. Atherogenic cells are cells which have the potential to develop atherosclerotic plaques. The ORFX polypeptides and nucleic acids are useful for treating or preventing a pathological condition associated with an ORFX-associated disorder, e.g. cancer, cardiovascular disease, allergy, autoimmune disease, wound healing, blood coagulation disorders or inflammatory disorders.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USFTO web site at seqdata.uspto.gov/sequence.html?DocID=20020082206.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to novel human ORFX polypeptides and their

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell.cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Drosophila; developmental biology; cell signalling; insecticide;

The invention relates to an expression system (A) that provides increased expression of copper-dependent secreted proteins (I) in eukaryotic cells comprises a gene (II) that encodes (I) and at least one cooper homeostasis gene (III). (A) is used to express enzymes, especially laccase, that require copper as co-factor. (III) transports copper to the present sequence is that of the Trametes versicolor Laccase (I). encoding polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Expression system for increased production of copper-dependent enzymes, particularly laccase, includes the gene for a copper homeostasis protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pred. No, is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 5,
